■ Future Trends of Electricity in the World

## **Future Trends of Electricity in the World**

---

Today the social, political and economic crisis and the issues such as restrictions endured fossil reserves, environmental concerns, crowds, economic growth and consumption index are the subjects that are thought by thinkers' to find the suitable strategies in solving energy problems in the world, especially environmental crises. On the other hand since the political and economic support of countries depends on the rate of productivity fossil energy sources, to be empty fossil resources is not only a threat to the economy of the exported countries, but also is the main concern of economic system of the imported countries. Current using of the fossil reserves may lead to less productivity and ultimately to be empty the reserves in future.

Fortunately most countries of the world have been realized to importance and role of various resources of energy especially renewable energies in supplying the present and future needs and have done great researches and principle investments in the operation of development of these resources. With regard to such increasing and main tendency in using the renewable energies and its technologies in industrial and in-developing countries, it is necessary that basic strategies and plans are followed.

Pollutants caused by the combustion and increasing the density of CO<sub>2</sub> in the atmosphere and its consequences have faced the world with irrevocable and threatening changes. The increase in temperature on earth, climate changes, sea levels and eventually intensified international conflicts are some of these consequences. This has persuaded the policy makers to offer policies and standards for control of environmental and researchers to develop resources with less pollution and renewing.

All renewable energy resources share more in energy supply system in the world. The sources simultaneously answer to both main features of fossil resources as follows: renewable energies are compatible with environment and have not any pollution and because of renewing, there is no final for them. Another characteristic of these resources is their distribution and to be widespread in the world. Therefore, a special role has been allocated to these resources in the international policies and programs such as

in programs of United Nations in order to global stable development. However adjusting these resources with the current system of energy consumption in the world has still some difficulties that for solving them important scientific researches in recent years have been allocated.

In other hand the technology of construction and operation of each energy, environmental issues, technical characteristics, possibility of having access, the geographical distribution and other features have its own characteristic. Therefore, the variety of use of various energies will be caused country to have more reliable situation and it is necessary that their technologies is established in the country. Of course, the technology which is dependent on industry greatly is raw material of internal resources, and needs less foreign currency and on the other hand employment opportunities and increasing domestic production are realized. To reach this goal, it is necessary to modify the real prices of various energies and the essential measures are done to promote private sector.

According to presented programs by country's electricity industry in short-term period in a next decade, access to electronic power systems will be provided in electricity industry based on Silicon or Post Silicon to control of power supply system. Integration of decentralized generation and local storing in the form of a new architecture is proper for the future competitive market. On the other hand, country's electricity industry will follow new and proper services which interact with customers and based on customer needs. To accelerate in the world using of clean fossil technologies which are the most efficient and best methods to generate electric energy is of other measures that will be done in country's electricity industry. One of goals of country's electricity industry is development of electric energy generating systems in short-term periods that is proper in environmental features for in-developing countries.

As well as accelerating in the research and development projects in order to increase productivity of equipments for electric power costumers is from other cases that country's electricity industry pay attention to it in short-term goals. All these cases are caused that general policies of electricity industry are organized toward using of equipments and new technologies and knowledge in electricity industry.

In connection with general goal of power industry it should be mentioned that in the long term with a look at the perspective of the future, global use of electric power for better use of energy resources, the earth, water and to minimize industry, agriculture and cities garbage to create a framework for stable future is planning. On the other hand comprehensive development and compatible with the global prospect in the field of power supply reduce costs and improve environmental performance of the infrastructures is concerned. In other words to create new facilities compatible with the needs besides development, technology and innovation in this industry it must move in such way that it is befitted of the best facilities.

For example, electric based transportation may increase the electricity consumption of the world up to 15 percent in the next 50 years that in turn would reduce the consumption of oil products. It should be noticed that this trend does not necessarily mean the increase of electric power generation through traditional means of electric power generation, (considering the overview, which exists about fuel cells and technological development for storage of electricity).

Looking more curiously to the future energy consumption shows that utilizing nuclear energy development is complying with environmental issues. Making managerial decisions for different countries may be varied according to each country situation. Development of the nuclear power plants becomes more attractive when energy demand is growing very quickly. As nuclear technology is improving worldwide

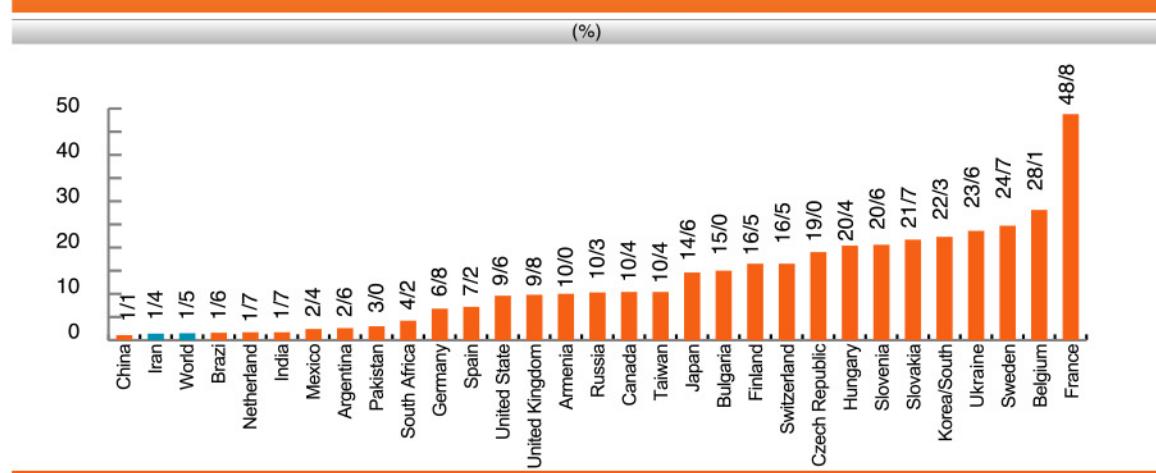

continuously and several countries are obtaining and reaching this technology edges, considering some new aspects cannot be neglected. Quality warranty, management and dividing the know-how and applying the international accepted standards, considering necessary security and protection issues and improving cooperation levels are some of the issues.

Most of new nuclear power plants in the near future will be based on the new and developed plans and of course with the previous system. Now 20 members of IAEA are currently engaged in providing new reactors and new plans of fuel cycle.

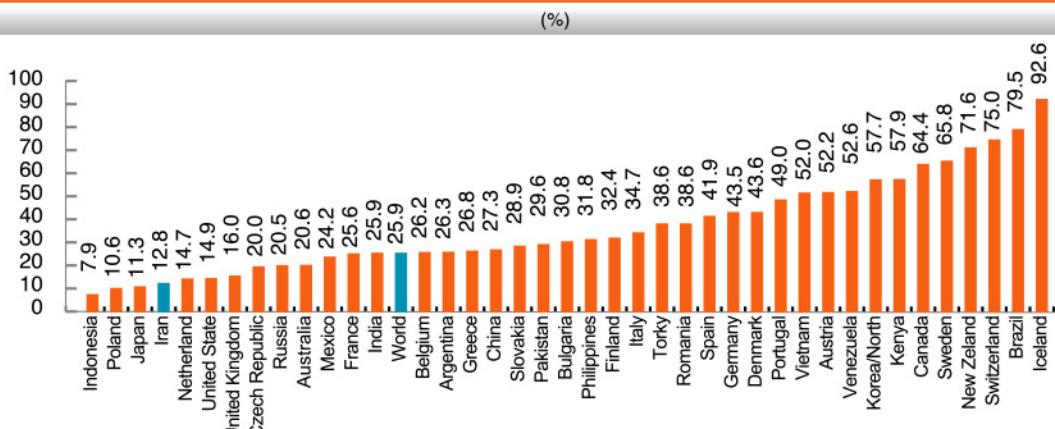

With the increasing prices of fossil fuels, renewable energies will find the special position in the energy supply in the world. In next 20 years, the need of world energy will increase about 60 per cent. This is while that in the 21<sup>st</sup> century A. D., energy fossil-fuel resources such as coal, oil and gas fuels are finishing. The future of energy of the world is dependent on science and technology development in production and consumption of energy, the prices and decision-making politicians in the field of energy. Now due to the high cost, renewable energies may not challenge with the fossil fuels. However with increasing in fossil fuels prices, renewable energies will have a special position.

The shares of nuclear and renewable power plants are shown respectively in charts (38) and (39) in some countries of the world. As well as, charts (40)-(43) show the average growth of installed capacity, generation, consumption and population respectively for the past 10 years in different regions of the world.

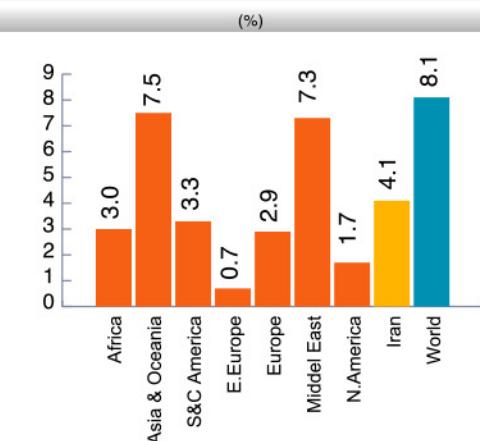

**Diagram (38): Contribution of Atomic Power Plants to Installed Capacity of a Number of World's Countries at the end of 2012**

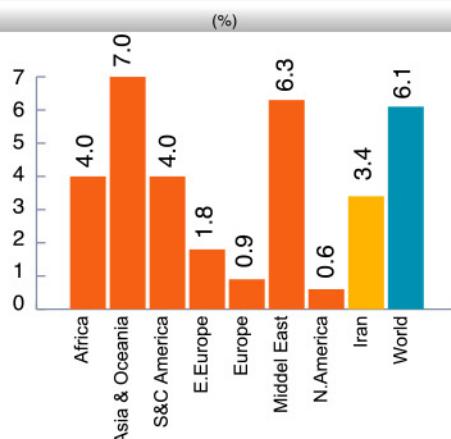

**Diagram (39): Contribution of Renewable Power Plants To Installed Capacity  
of a Number of World's Countries at the end of 2012**

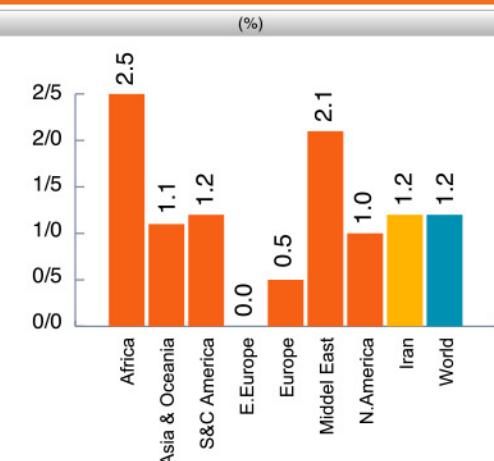

**Diagram (40): Average Percent Growth of Installed Capacity during the Past Decade**

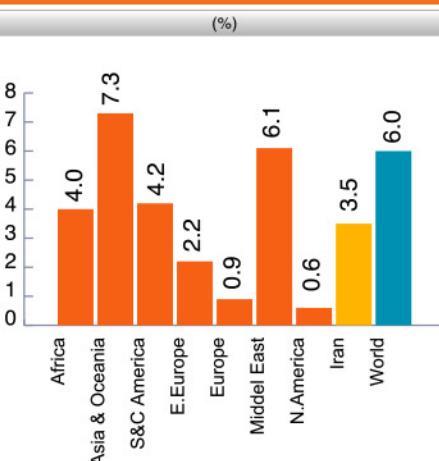

**Diagram (41): Average Percent Growth of Electricity Energy Generation During the Past Decade**

**Diagram (42): Average Percent Growth of Electricity Energy Consumption During the Past Decade**

**Diagram (43): Average Percent Growth of Population During the Past Decade**

## Definitions

---

### Generation

#### **Steam Power Plant:**

The power plant in which the thermal energy in liquid, solid and gas fuels to generate steam and its consumption in steam turbines to generate electricity is used.

#### **Gas Power Plant:**

The power plant in which the thermal energy in liquid and gas fuels to generate hot gas and its consumption in gas turbines to generate electricity is used.

#### **Combined Cycle Power Plant:**

In a combined cycle power plant, the heat of the gas turbine's exhaust is used to generate steam by passing it through a heat recovery steam generator.

#### **Diesel Power Plant:**

A diesel power plant is the combination of a diesel engine with an electrical generator (often an alternator) to generate electrical energy.

#### **Hydro-Electric Power Plant:**

It is the term referring to electricity generated by hydropower; the production of electrical power through the use of the gravitational force of falling or flowing water.

### **Transmission and sub-transmission Network:**

A network is included substations, overhead lines, cables and other electrical equipment to transit energy from power plants to end users.

#### **Substation:**

A substation is included a series of electrical equipment e.g. transformers, circuit breakers, disconnectors, instrument devices, in/out-coming feeders, reactor and capacitor and various Bays for transmission and distribution of electricity.

**GIS Substation:** A gas insulated substation is an electrical substation in which the major structures are contained in a sealed environment with sulfur hexafluoride gas as the insulating medium.

**Voltage:** Voltage is a difference between two points of a circuit

**Transformer:** A transformer is a static electrical device that transfers energy by inductive coupling between its winding circuits.

#### **Distribution**

**Distribution Network:** A series of medium and low voltage overhead lines, underground cables and substations to distribute electricity energy in an area.

### **Management of Information Technology and Statistics:**

Tavanir, Shahid ghasemi Building, Rashid Yasemi St. Vali Asr Ave.  
Tehran, Iran P.O.Box: 14155-6467

Web: <http://amar.tavanir.org.ir>  
E-mail: infocdat@tavanir.org.ir

Since its establishment, Management of Information Technology and statistics has been in charge of collecting, processing and issuing the data related to the activities of Electricity Industry in the country. For this purpose, it has attempted to equip itself so to go along with new quantity and quality developments in this industry, and meet all information requirements. Periodicals issued annually by this group include:

- Detailed statistics about Iran Electric Power Industry (for strategic management)
- Statistics of rural electrification
- Detailed statistics of power generation in Iran
- Detailed statistics of power transmission in Iran
- Detailed statistics of power distribution in Iran
- Detailed statistics about Iran Electric Power Industry (for management)
- 10 Years trend of Iran Electric Power Industry (by REC.s, Distribution Cos and Provinces)
- Statistical report on Iran Electric Power Industry (both in persian and in english)
- Iran Electric Power Industry (both in persian and in english)
- Weekly buletin
- Electronic version of all above-mentioned on DVD
- Iran Electric Power Industry monthly bulletin & projects through Tavanir website as "Iran Electricity Statistics News"
- Iran Electric Power Industry statistics on Tavanir website

The report of Iran's electricity industry is containing the latest information from current situation and its development in the fourth economic and social development planning and comparing it with the electricity of other countries in the world.
