Executive Summary

A. Background

The proposed Nepal Power Sector Reform and Sustainable Hydropower Development Project (PSRSHDP), the Project, intends to offer a holistic and coherent set of technical and analytical studies capacity-building activities and policy dialog on the energy sector in Nepal, and preparation of next-step critical hydropower and transmission line projects to prepare Nepal for upcoming large-scale private and public investments in hydropower. The project is an advisory support that will not finance any civil works or physical implementation, under any circumstances. This Environmental and Social Management Framework (ESMF) lays out the specific requirements, processes, and responsibilities for ensuring that the activities of the Project are carried out in a manner that complies with World Bank safeguard policies and Nepal’s environmental and social laws and regulations and to enhance the Project’s positive impact on enhancing the environmental and social sustainability of power sector investments in Nepal.

This executive summary explains the main aspects of environmental and social management of the proposed Project. More detail is available in the full ESMF, including its detailed annexes. The Full ESMF is available for download at

NEA:  http://www.nea.org.np/publications.html

B. Brief Project Description

The Project Development Objectives are to strengthen the capacity of: (a) the power sector agencies to plan and prepare hydropower and transmission line projects following international standards and best practices; and (b) the GON agencies to improve [prepare] the policy, legal and regulatory framework for sustainable water resource management and hydropower development.

The proposed Project has three components: (i) Preparation of Hydropower and Transmission Line Investment Projects; (ii) Studies for Policy Recommendations and Sector Reform; and (iii) Capacity Building for Safeguard Management and Hydropower Development. More information is provided below on the components:

- **Component A: Preparation of Hydropower and Transmission Line Investment Projects** (IDA Credit $20 million).
- **Component B: Studies for Policy Recommendations and Sector Reform** (SAWI Grant US$2.0 million and PPIAF Grant US$2.0 million).
- **Component C: Capacity Building for Safeguard Management and Hydropower Development** (SAWI Grant US$0.5 million, PPIAF Grant $0.5 million).

C. Environmental and Social Compliance Requirements

The future infrastructure investments which are the focus of studies under Component A, as well as development of policy reforms and preparation of integrated basin plans may have significant environmental and social impacts and/or consequences (positive or negative). Therefore, environmental and social impact assessments and mitigation plans will be conducted to fully assess and identify necessary mitigation measures for negative impacts, as well as measures to enhance
positive effects. The assessments will be done in compliance with and subjected to Nepal’s own environmental social requirements, laws, regulations and approval processes, and the international conventions Nepal is a party to and has ratified. Furthermore, as this Project is proposed to be financed by the World Bank, the Project is required to meet the requirements of relevant World Bank environmental and social safeguard policies. The Project is assigned an Environmental Assessment Category "A" as per World Bank Operational Policy (OP) 4.01. Compliance with World Bank policies will include ensuring in-depth environmental and social impact assessment and management planning as well as consultations with all stakeholders for preparation of detailed engineering design and ESIA of the hydropower and transmission line investments proposed under Component A. World Bank standards also require stakeholder consultations and involvement more broadly with regard to the basin planning and policy reform studies and activities proposed under Components B and C.

D. Environmental and Social Issues of the identified investment projects to be prepared under Component A

Under Component A, the GoN has proposed the Upper Arun (335 MW) hydroelectricity project (UAHEP) and the Ikhuwa Khola (30 MW) hydropower project (IKHP), for preparation studies. The UAHEP is proposed to be located on the Arun River in Sankhuasabha District of eastern Nepal, while the IKHP site is located on a tributary to the Arun River approximately 8 km downstream of the proposed UAHEP powerhouse site. (See Annex A for a map showing the proposed locations of each project.) The IKHP would be prepared under this Project in tandem with the UAHEP to provide a source of benefit sharing and also power supply to local communities.

The GoN will also identify an additional transmission line project, which has not yet been identified, for preparation under this Project during the implementation stage of the proposed Project.

E. List and Scope of Studies and Safeguard Instruments to be Prepared during Implementation of the Proposed Project.

E.1 During the preparation studies the following safeguard documents will be prepared for preparation of the Upper Arun (UAHEP) and Ikhuwa Khola (IKHP) Hydropower Projects:

- Environmental and Social Impact Assessment (ESIA) for both UAHEP and IKHP
- Environmental and Social Management Plan (ESMP) for UAHEP
- Environmental and Social Management Plan (ESMP) for IKHP
- Cumulative Impact Assessment (CIA) of the Arun River Watershed
- Resettlement Policy Framework (RPF)
- Resettlement Action Plan (RAPs)
- Vulnerable and Indigenous Peoples Development Plan
- Downstream Impacts Management Plan
- Gender Assessment and Action Plan
- Benefit-sharing Action Plan
- Public Health Assessment and Action Plan
- Public Participation and Consultation Plan
- One Executive Summary of these documents, in English and Nepali
- Dam Safety Plans

E2. Safeguards Approach for the yet to be identified additional Transmission project to be prepared through the proposed Project
During implementation of the proposed Project, the GoN may seek the World Bank’s concurrence for the Project to finance the required preparation studies and documentation for a new transmission line. Once the target transmission line investment is identified, the NEA and the World Bank will screen the proposed Project to determine the applicable Banks safeguards policies as well as national laws and regulations, and to develop detailed Terms of Reference for the corresponding required environmental and social studies in accordance with applicable GoN legal requirements and World Bank safeguard policies. The impact assessments of the power transmission line will also consider cumulative impacts of other linear infrastructure such as roads and other transmission lines, and contribute to coordination among the linear infrastructure planning and development so as to optimize land-uses, avoid/minimize adverse impacts such as resettlement footprints, deforestation, landslides/soil erosion and reduce Right of Way (RoW) expenditures.

E.3 Studies to be prepared for other aspects of the proposed project, covered under Components B and C.

Under Component B, a number of studies will be financed, which include inter alia, basin-wide approach for water resource and hydropower development planning for several major basins in Nepal. This will involve developing an integrated database of basin-level information and carrying out integrated basin wide planning processes, which will also include a Strategic Environmental and Social Assessment (SESA) to specifically focus on the social and environmental aspects and considerations in planning for water resource use, allocation and sustainable management at a basin scale. The streamlining of forest clearance process will be another important activity under component B which will be developed under the leadership of forest agencies and in close participation and consultation with forest and wildlife sectors. This activity will not weaken the forest clearance requirements, but rather will aim to improve the efficiency of the clearance process by revising information flow, communication and administrative processes across involved agencies.

Component C will meanwhile focus on improving the environmental and social safeguard management systems and associated capacity building of key agencies in GoN responsible for power development, especially hydropower. The studies and activities will include policy development, and capacity building for cumulative/strategic impact assessment, ecological flows, hydropower resettlement and benefit sharing, gender equity, integrating climate change and disaster risk management aspects into hydropower planning, basin planning, and developing of NEA corporate policy for compensation of transmission line ROW. These activities are expected to have significant environmental and social benefits in the context of increasing development of the power and especially hydropower sector in Nepal.

F. Institutional and monitoring arrangements

The technical work will be contracted and overseen by the following specific implementing agencies within GoN- NEA will be responsible for the studies for specific investments under Component A; WECS will be responsible for the studies under Component B including integrated basin planning; and DOED will be responsible for the studies and capacity building activities under Component C. The overall Project will be managed by their respective Project Management Units (PMUs). Component B and C will be further coordinated by a high level central Project Steering Committee, reporting directly to the Energy Secretary.

G. Public consultations and brief description of the Communications Strategy.

Two rounds of public consultations have been conducted for the Project so far. The first round consultation was for UAHEP and IKHP, the consultation event was held on the initial draft TORs for the ESIAs and social planning studies on April 30, 2014 as part of preparation of this proposed
Project, and the TORs (attached as an annex to the full ESMF) have been updated by NEA to reflect feedback received. Additional consultations will be held on the draft studies.

The second round of public consultation for the ESMF of the Project was organized by NEA, DOED and WECS, on December 23, 2014 to consult with the Project stakeholders outlining the safeguards compliance strategy, requirements and processes across all project components, and including the detailed Terms of Reference (TORs) for environmental and social assessments and studies for the UAHEP and IKHP investments. Similar consultation requirements are expected to apply to the transmission line investment to be identified and studied under this Project. Similarly, updating of environmental and social regulations and procedures for hydropower (an activity under Component C) will include a broad consultation with public sector and civil society stakeholders at the national level, in addition to private sector, so that inputs from diverse stakeholders into updating the policies and regulations are considered.

Furthermore, NEA will establish a project-specific website, where information about the specific investments being prepared under the project (for now covering UAHEP and IKHP) can be accessed. For now, NEA has been publishing the UAHEP and IKHP project related information in its corporate website this website will be accessible via:

ENVIRONMENTAL AND SOCIAL MANAGEMENT FRAMEWORK (ESMF)

FOR

POWER SECTOR REFORM AND SUSTAINABLE HYDROPOWER DEVELOPMENT PROJECT (PSRSHDP)

January 2015

A. Background

1. The proposed Nepal Power Sector Reform and Sustainable Hydropower Development Project (PSRSHDP) intends to develop technical and analytical studies, capacity-building activities and policy dialog on the energy sector in Nepal, and preparation of next-step critical hydropower and transmission line projects to prepare Nepal for upcoming large-scale private and public investments in hydropower.

2. The project will provide advisory services for preparation of hydropower and transmission line projects and associated capacity building, but will not finance any civil works or physical implementation whatsoever, under any circumstance. Therefore, the PSRSHDP would not have any direct environmental or social impacts. To the contrary, the project overall is expected to result in significant environmental and social benefits by preparing critical studies, policy and planning recommendations, and capacity for improved management and integration of environmental and social considerations in the hydropower sector.

3. Nonetheless, the future infrastructure investments to be studied and prepared under the project may have significant environmental and social impacts. Likewise, the studies and activities related to water resources and basin planning, development and/or reform of regulations and guidelines, and capacity building in the power, and especially hydropower, sector will also shape how power sector investments take place in the future, with implications for the environment and affected communities.

4. This Environmental and Social Management Framework (ESMF) lays out the specific requirements, processes, and responsibilities for ensuring that the activities of the project are carried out in a manner that complies with World Bank safeguard policies and Nepal’s environmental and social laws and regulations and to enhance the project’s positive impact on enhancing environmental and social sustainability of power sector investments in Nepal.

B. Brief Project Description

5. The Project Development Objectives are to strengthen the capacity of: (a) the power sector agencies to plan and prepare hydropower and transmission line projects following international standards and best practices; and (b) the GON agencies to improve [prepare] the policy, legal and regulatory framework for sustainable water resource management and hydropower development.

6. This Project intends to offer a holistic and coherent set of technical and analytical studies, capacity-building activities and policy dialog on the energy sector, and preparation of next-step critical hydropower and transmission line projects to prepare Nepal for upcoming large-scale private and public investments in hydropower.

7. The proposed Project has three components: (i) Preparation of Hydropower and Transmission Line Investment Projects; (ii) Studies for Policy Recommendations and Sector Reform; and (iii)
Capacity Building for Safeguard Management and Hydropower Development. More information is provided below on the components:

- **Component A: Preparation of Hydropower and Transmission Line Investment Projects** (IDA Credit $20 million). The GoN has officially proposed the Upper Arun (335 MW) and Iikuwa Khola (30 MW) for Bank support for project preparation. This component will support preparation of two hydropower projects as proposed by the GoN, and one cross-border high voltage transmission line project following recommendations of the Transmission System Master Planning supported under the on-going NIETTP. Preparation of projects will follow international standards and World Bank Safeguard Policies for preparation of project design, bidding documents, and environmental and social impact assessment and mitigation planning, and support construction supervision and management of these projects.

- **Component B: Studies for Policy Recommendations and Sector Reform** (SAWI Grant US$2.0 million and PPIAF\(^1\) Grant US$2.0 million). This component will address critical power sector issues. This component will support preparation of (a) Power System Expansion Strategy, including a Generation Master Plan (PPIAF); (b) an action plan for NEA institutional restructuring (PPIAF); (c) integrated water resource planning and management to guide sustainable hydropower development (SAWI); (d) revised Water Resource Policy, WECS Act, Electricity Act and Regulatory Commission Act (PPIAF); (e) streamline of forestry clearance process and procedures (PPIAF); and (f) GoN policies to facilitate private investment in hydropower and transmission line, e.g. the need of GoN guarantee (PPIAF); (g) a road map for establishment of power sector regulatory institution; and (h) power trading strategy and associated capacity building. It will prioritize and sequence study recommendations for actions, build consensus and enhance capacity for follow-on implementation under the planned DPC operations.

- **Component C: Capacity Building for Safeguard Management and Hydropower Development** (SAWI Grant US$0.5 million, PPIAF Grant $0.5 million). The component will support improving the environmental and social safeguard management system and associated capacity building, including:
  
  (a) Preparation of recommendations for updating environmental and social regulations and procedures for hydropower development, covering the following areas:
  
  - Cumulative/strategic impact assessment, including minimum ecological flows, in a basin-wide approach;
  - Hydropower resettlement and benefit sharing and gender equality; and
  - Adoption of recommendation for mitigating impacts of climate change on water resources and hydropower, which is being reviewed through an ongoing Bank funded TA (results will be shared in 2015).

  (b) Preparation of NEA corporate policy for compensation of transmission line right-of-way (ROW);

  (c) Safeguard capacity-building, including capacity building in understanding the impacts of climate change and disaster risk management in hydropower planning and operations, and support to NEA, WECS, MoE and other GoN agencies for development of hydropower and associated facilities.

**C. Environmental and Social Compliance Requirements**

\(^1\) Commitment of PPIAF funding is to be confirmed.
8. Although the studies and capacity building activities to be conducted under this project will not themselves generate any adverse environmental or social impacts, the future infrastructure investments which are the focus of studies under Component A, as well as development of policy reforms (in particular the corporate policy for compensation along transmission line ROWs) and preparation of integrated basin plans may have significant potential environmental and social impacts and/or consequences (positive and negative). Therefore, environmental and social impact assessments and plans will be conducted to fully assess and identify necessary mitigation measures for negative impacts, as well as measures to enhance positive effects. The assessments will be done in compliance with and subjected to Nepal’s own environmental social requirements, laws, regulations and approval processes, and the international conventions Nepal is a party to and has ratified. Furthermore, as the project is proposed to be financed by the World Bank, the project is required to meet the requirements of relevant World Bank environmental and social operational policies. Therefore, the project is assigned an Environmental Assessment Category “A” as per World Bank Operational Policy (OP) 4.01. Classification of the proposed TA project as a Category A project will ensure that the environmental and social studies to be carried out for specific proposed investments, as well as technical guidance and preparation of regulations on environmental and social management aspects of hydropower, meet the requirements of these policies. This includes in-depth environmental and social impact assessment and management planning, as well as consultations with all stakeholders of the corresponding proposed hydropower and transmission line investments being prepared under Component A. The Project will engage stakeholder consultation and involvement more broadly with regard to basin planning and policy reform studies being carried out under Components B and C.

9. The following World Bank safeguard policies are likely to be triggered under the proposed project:

- Environmental Assessment OP4.01
- Natural Habitats OP4.04
- Forests OP4.36
- Physical Cultural Resources OP4.11
- Indigenous Peoples OP 4.10
- Involuntary Resettlement OP4.12
- Safety of Dams OP4.37
- International Waterways (OP 7.50)

D. Environmental and Social Issues of the identified investment projects to be prepared under Component A

10. Under Component A, the GoN has included the Upper Arun (335 MW) hydropower project, which includes the Ikhuwa Khola (30 MW) hydropower project for funding of the preparation studies. The GoN will also identify and prepare an additional transmission line project during the implementation stage of the proposed project, which has not yet been identified.

---

2As of the date of this document, the World Bank has not committed to fund the implementation of the potential investments/projects with respect to which technical assistance is being provided under this Project. Any works related to potential investments for which technical assistance is provided under this Project which are initiated and/or undertaken during the period of implementation of this Project shall be undertaken in compliance with the ESMF and the applicable World Bank environmental and social safeguard policies regardless of the source of financing for such works. Furthermore, in the event that the Government of Nepal finances the implementation of the potential investments/projects that have been prepared under this TA project, with or without funding from the World Bank, then the Government of Nepal shall be responsible for ensuring the implementation of the said investments/projects are compliant with the corresponding studies and documents prepared under this TA project, and hence are compliant with requirements of the applicable World Bank policies.
D1. Upper Arun and Ikuhuwa Khola Hydropower Projects

Below is a brief summary of key project aspects for the proposed UAHEP and IKHP projects. More information on the project, as well as the study requirements, be found in the draft Terms of Reference for the detailed Environmental and Social Impact Assessment (ESIA), Cumulative Impact Assessment (CIA) and social planning studies in Annex A. In addition, a map showing the locations of the proposed investments is included in Annex D.

11. Upper Arun Hydroelectric Project (UAHEP). The UAHEP is a proposed 335 MW hydroelectric facility to be located on the Arun River in Sankhuasabha District of eastern Nepal. The project area is situated within Longitude 87°20'00” to 87°30'00” East and Latitude 27°38’24” to 27°48’09” North, about 15km south of the international border with Tibet and 220 km east of Kathmandu. The proposed dam site is located in the Chepuwa Village, in a narrow gorge about 350m upstream of the Arun River’s confluence with the Chepuwa River. The proposed power plant site is located in the Hatiya Village 16km downstream of the dam site, near the Arun River’s confluence with the Leksuwa River. The right bank of the Arun River at the proposed UAHEP site falls within the Makalu Barun Buffer Zone, which is adjacent to the Makalu Barun National Park. The proposed UAHEP dam site is therefore located at the edge of the Buffer Zone. UAHEP is the upstream most of the three major hydropower projects currently identified and under preparation in the Arun Basin, the other two being the 900 MW Arun III project and the 300 MW Lower Arun project, both of which are more advanced in their preparation status and have already been licensed to IPPs.

12. UAHEP salient features. As informed by an initial feasibility study completed in 1991, the proposed UAHEP is designed to be a Peaking Run of the River (PRoR) project with gated weir across the Arun River. Intakes on the left bank of the river are proposed to divert the design discharge of 78.8 m³/s through an intake tunnel to three underground desanding basins, a headrace tunnel of 7.8 km, surge tank, drop shaft, pressure tunnel, and ultimately to the underground powerhouse for power generation. Water would be retained for a period of a few hours only in a peaking pond and then released through the tunnel during peak hours. After power generation, water will be released back to the Arun River. A capacity optimization study in 2011 established the proposed UAHEP’s capacity of 335 MW and annual energy generation of 2598 GWh.

13. Ikuhuwa Khola Hydroelectric Project (IKHP). NEA has also proposed to develop the 30 MW IKHP, a medium sized hydropower project, in tandem with the UAHEP. The proposed IKHP site is located on a tributary to the Arun River approximately 8 km downstream of the proposed UAHEP powerhouse site. The IKHP project is envisioned to provide a source of benefit sharing and also power supply to local communities, and may be jointly developed with the participation of the local community. The Department of Electricity Development (DoED) of the Government of Nepal is currently working on a feasibility study and an initial environmental examination (IEE) for IKHP.

14. Site access. The proposed UAHEP and IKHP sites are not presently accessible by motorable road. Three access roads are proposed, including Num-Kimathanka access road, the UAHEP Project Access Road and IKHP Access Road.

15. Power transmission. A power evacuation study for the UAHEP and IKHP projects has not yet been carried out. The current proposed option by NEA is to use the proposed Koshi Corridor transmission line up to Khandbari, being financed by Indian EXIM bank, and NEA will extend 220 kV line with length of 45 km to UAHEP site. The detailed engineering design study for the UAHEP project will evaluate this and any other options to connect to the national grid to inform a final decision on both alignment and design. A lower voltage transmission line will meanwhile be constructed to connect the IKHP powerhouse to the local grid to supply energy to the local communities. Final decisions regarding the route for the IKHP’s transmission line will be determined during detailed design of that component.
16. **Ancillary works and other possible linked activities.** Various ancillary works will be required for project implementation, including contractor camps, diesel generators for construction-stage power supply, spoil and waste rock disposal areas, borrow areas, NEA staff housing, etc. These, and any other activities associated with the project that could be considered “linked activities” as defined in World Bank OP 4.12 (Para 4) – e.g., activities which are directly related, necessary to achieve the Project objectives, and planned to be carried out contemporaneously – shall also be covered under studies funded by the proposed project.

17. **Key Environmental Issues:** The environmental impact on land, water, flora and fauna of the UAHEP and IKHP are expected to be widespread and potential severe across the various projects sites and influence areas if not properly managed and these impacts would occur during the construction, operations and maintenance phases. The primary areas of influence would be the upstream catchment area, the temporary water storage area between peaking cycles, the Dam sites, the tunnel corridors, plant room location, the immediate area downstream of the Dam and upstream of the power house where the significantly reduced flows would be occur, areas further downstream to be affected by changes to river flows and water quality/turbidity, the access roads, the quarry sites, disposal areas and campsites. Given the mountainous area and undulating landscape that is fairly untouched and pristine at the current time, erosion and sedimentation issues would need to be evaluated and managed in all areas during the construction, operation and maintenance, including ensuring that slope areas are well protected and drained. Managing water quality in the upstream areas and ensuring adequate environmental/riparian flows are also issues to be evaluated and managed carefully. In addition, influx of workforce and changes to local livelihoods as a result of the project may indirectly increase pressures on forests and other natural resources in the broader project area. Cumulative effects on hydrology, sediment movement and erosion, aquatic and terrestrial biodiversity, and other environmental aspects of UAHEP, IKHP and other planned hydropower projects in the Arun River watershed (notably Arun III and Lower Arun) may also result.

18. **Physical Cultural Resources:** There is currently no documentation available of archaeological or other physical cultural resource sites within the various project site locations. These would be investigated as part of the ESIA process and procedures for chance finds of any artifact/site of archeological significance occurs during construction or any contemporary structures and/or places of spiritual and religious importance are put in place.

19. **Key Social Issues:** The proposed project will require land acquisition and possibly small number of relocations. Given the sparse population in the project areas and the deep gorge of the reservoir area, these impacts are expected to be small according to impact screening at feasibility study. There are indigenous communities in the project areas. They will be subject to adverse impacts under the project, but they are also among the project beneficiaries. In addition to project benefits of power generation, the project is expected to contribute to and promote the socioeconomic development in the local areas, benefitting local communities, particularly the indigenous and vulnerable communities.

E. **List and Scope of Studies and Safeguard Instruments to be Prepared during Implementation of the Proposed Project.**

20. For Upper Arun (UAHEP) and Ikuhuwa Khola (IKHP) Hydropower Projects, the safeguards documents required are the following. Details of each are available in the complete TOR in Annex A.

- Environmental and Social Impact Assessment (ESIA) for both UAHEP and IKHP
- Environmental and Social Management Plan (ESMP) for UAHEP
• Environmental and Social Management Plan (ESMP) for IKHP
• Cumulative Impact Assessment (CIA) of the Arun River Watershed
• Resettlement Policy Framework (RPF)
• Resettlement Action Plan (RAP)
• Vulnerable and Indigenous Peoples Development Plan
• Downstream Impacts Management Plan
• Gender Assessment and Action Plan
• Benefit-sharing Action Plan
• Public Health Assessment and Action Plan
• Public Participation and Consultation Plan
• Communication Strategy and Action Plan
• One Executive Summary of these documents, in both English and Nepali
• Dam Safety Plans

Responsibility for preparing them: Nepal Electricity Authority (NEA)

Expected Start Date: July 2015

Terms of Reference for these studies: attached in Annex A of this ESMF

Source of financing: Financed under Component A of the proposed project

Broad scope of each study/document

21. **Environmental and Social Impact Assessment** – ESIA will be carried out by consulting firms independent of the engineering forms and proponents. The consultant will carry out screening and scoping, modification of the TOR as necessary depending on results of scoping, collection and analysis of primary and secondary data, and consultations with stakeholders in order to identify and assess qualitatively and quantitatively, the potential and adverse environmental and social impacts be they direct, indirect, induced and cumulative including impacts on critical natural habitat. The assessment will identify necessary measures to first avoid, or otherwise reduce, mitigate and/or manage and/or compensate for such negative impacts and enhance positive effects, in accordance with Government of Nepal’s requirements and the World Banks triggered safeguard policies.

22. **Environmental and Social Management Plans**– Each ESIA report will include an ESMP as a chapter or volume, which will contain all the required mitigation and monitoring measures (including indicators to measure performance) to be implemented during construction, and operations and maintenance phases. The ESMPs will specify the institutional responsibilities for carrying out each measure or action, as well as management arrangements, timelines, budget, and required capacity building measures for their implementation. The ESMPs will contain sub-plans as appropriate to cover specific issues. For example, one critical issue already identified to be covered under the ESMPs relates to ecological flows, given that the construction of the dam will alter the natural flow of the river thus affecting the river ecosystems and the human livelihoods that depend on them. To ensure that these impacts are reduced and avoided and that adequate flow is maintained downstream for sustaining fresh water, the ESMPs shall contain ecological management plans for UAHEP and IKHP. These plans will quantify the required environmental flow through various studies and analysis which will address the river’s extreme low flows, high flow pulses, small floods, and large floods and restore sediment deposition, addressing the life-cycle needs of fish/aquatic life as well as wildlife, if relevant and addressing the river-based livelihoods of communities.

23. **Cumulative Impact Assessment (CIA)** – will focus on identified Valued Environmental (and Social) Components (VECs) which may be affected by the UAHEP and IKHP projects, and other development activities planned or underway throughout the Arun River watershed, including the upstream catchment, irrespective of their source of financing. The CIA will recommend project level as well as strategic planning level recommendations for minimizing negative impacts and
maximizing positive impacts associated at the basin level. The CIA will also consider and coordinate with other linear infrastructure such as roads, and power transmission line to minimize the resettlement footprints and reduce RoW expenditures.

24. **Resettlement Policy Framework (RPF)** – will contain the measures and procedures that must be complied with when land acquisition that has not been identified during the planning process is required.

25. **Resettlement Action Plan (RAP)** – will identify all impacts of known land acquisition and resettlement, requirements of complying with GoN and World Bank requirements and policies when land acquisition occurs, and the entitlement policy and matrix, and the detailed plan to implement these measures and entitlements prior to the land being acquired. The RAPs will contain, inter alia, an inventory survey of physical impacts, census survey of affected populations, review of relevant legal policies, entitlement plans, livelihood restoration and development measures and the grievance redress and monitoring mechanisms.

26. **Vulnerable and Indigenous Peoples Development Plan** – as the UAHEP and IKHP areas are inhabited by several indigenous communities classified and officially recognized by the GoN, the plan will contain measures to avoid or minimize adverse impacts and maximize positive impacts on these communities.

27. **Downstream Impacts Management Plan** – as the dams will alter natural river flows downstream of the location of these dams, anticipated adverse environmental, social, cultural and economic impacts in the downstream areas will occur. To ensure these adverse impacts are avoided, minimized or mitigated or otherwise managed, the plan will identify, analyze and assess the possible downstream impacts, identify and inventory communities that are likely to be affected and will contain the necessary mitigation strategies and intervention measures based on the above analyses.

28. **Gender Assessment and Action Plan** - Women are important stakeholders in hydropower development, falling among both the affected and the beneficiaries. It is important to understand the gender dimensions of the project and the differential impacts on women so as to maximize project benefits.

29. **Benefit-sharing Action Plan** - will cover, but not be limited to; consultations with local stakeholders, in particular with local indigenous communities, over their expectations from this project; Review of benefit-sharing proposal from project feasibility studies for UAHEP and IKHP; Define “benefit-sharing,” design, and propose a benefit-sharing scheme for the project; and Include differential benefit analysis for those whose livelihoods and land values will be disproportionately enhanced by road provisioning/improvements. In addition, mechanisms like the PES (payment for environmental services) will also be included in review of benefit sharing. This type of mechanism which targets participatory conservation for promoting proper land use management in the uplands to reduce siltation will be proposed.

30. **Public Health Assessment and Action Plan** - The construction of the full project will have adverse public health impacts due to dust, noise, pollution, and migration of construction workers into the project. The transportation of heavy machine and equipment to the project area by road may cause additional hazards, accidents and human injuries. It is therefore necessary to generate awareness of potential impacts, and initiate both preventive and mitigation measures to minimize risks and possible harmful effects on public health.

31. **Public Participation and Consultation Plan** - Drawing from the stakeholder consultation strategy developed during the screening and scoping phase, this plan will cover the following objectives: (a) outline of the specific activities, logistics and schedule for the consultation and inter-agency coordination processes to take place throughout the environmental and social...
assessment and planning stage, ensuring that consultations are coordinated and executed together with different entities and at different levels (government, municipality, NGOs, local communities etc.) in order to capture a range of participants, and also to ensure the stakeholder consultation is continuous throughout the project; (b) possible avenues of public interaction, in addition to interviews and public meetings, especially through proactive use of social media and newer communication technology; (c) will identify points of entry for ensuring local people as more active participants (rather than simply respondents) in consultations, and (d) a strategy and required actions, including implementation arrangements, responsibilities and budget, for ongoing engagement, consultations, and grievance / dispute resolution activities throughout the life of the Project.

32. Communication Strategy and Action Plan - Given the remote location of the UAHEP and IKHP, the high profile of hydropower development, and the history of hydropower development in the Arun Valley in particular, it is important to develop a communication strategy for continuous communication between the project implementation authorities and all other stakeholders throughout the life of the projects. The objectives are to (i) help strengthen public understanding and support for the projects and create an enabling environment for their implementation; (ii) enable public communication and continuous flow of information on project activities, impacts, and benefits; (iii) manage relationships with key external stakeholder constituencies; and (iv) facilitate dispute resolution and public monitoring of project implementation.

33. Dam Safety Plans - this would include preparation and implementation of detailed plans for construction supervision and quality assurance for each dam (UAHEP and IKHP); instrumentation plans; operation and maintenance plans; and emergency preparedness and response plans. Prequalification of bidders during procurement and bid tendering for civil works and electromechanical contractors, and periodic safety inspections of the dams after completion, will also be required and specified in appropriate contractual documents.

**Dam Safety Panel of Experts**

34. In accordance with World Bank OP 4.37, a Dam Safety Panel of Experts will be appointed by NEA to undertake periodic, comprehensive and independent reviews of the design, construction and if needed, the initial reservoir filling of the completed dams.

**Responsibility:** The Dam safety Panel will be appointed by and report to the NEA. ToR of Dam Safety Panel of Experts will be cleared by the World Bank. **Expected start date:** July 2015

**Source of financing:** financed under Component A of the proposed project.

**Environmental and Social Panel of Experts**

35. In addition, given the potential high degree of sensitivity and complexity of the environmental and social issues related to the proposed project, in accordance with World Bank OP 4.01 NEA will engage an environmental and social panel of experts to provide independent advice and quality assurance for the environmental and social studies and management plans, and support NEA to effectively integrate the findings and recommendations of the various safeguards documents into the design, implementation plan and operational plan of the UAHEP and IKHP.

**Responsibility:** The Environmental and Social Panel of Experts will be appointed by and report to the NEA. ToR of Environmental and Social Panel of Experts will be cleared by the World Bank. **Expected start date:** July 2015

**Source of financing:** financed under Component A of the proposed project.
Capacity building of NEA

36. The TOR for the ESIA, CIA and Social Planning studies for UAHEP and IKHP furthermore includes a requirement for the consultant hired to help build NEA’s capacity on all aspects of environmental and social assessment and management planning for hydropower projects. In this regard, the consultant will be required to carry out training activities for NEA engineers, environmental and social staff, and to involve them to the maximum extent in all aspects of the studies as they are being executed. In this manner, NEA will not only gain experience of overseeing the aforementioned studies through the TA project, but will become more fully equipped to manage future hydropower investment planning processes in line with international standards on environmental and social aspects.

E2. Safeguards Approach for the yet to be identified Transmission project to be prepared through the proposed TA project

37. During implementation of the proposed project, the GoN may seek the World Bank’s concurrence for the project to finance the required preparation studies and documentation for a new transmission lines project.

38. Once the target transmission line investment is identified, the NEA and the World Bank will screen the proposed project to determine the applicable Banks safeguards policies as well as national laws and regulations, and to develop detailed Terms of Reference for the corresponding required environmental and social studies in accordance with applicable GoN legal requirements and World Bank safeguard policies. The impact assessments of the power transmission line will also consider cumulative impacts of other relevant linear infrastructure such as roads and other transmission lines, and contribute to coordination among the linear infrastructure planning and development so as to optimize land-uses, avoid/ minimize adverse impacts such as resettlement footprints, deforestation, landslides/ soil erosion and reduce RoW expenditures.

E.3 Studies to be prepared and other activities for other aspects of the proposed project, covered under Components B and C.

39. Studies under Component B (including Strategic Environmental and Social Assessment for river basin planning). Under Component B, a number of studies will be financed, which include inter alia, basin-wide approach for water resource and hydropower development planning for several major basins in Nepal. This will involve developing integrated basin wide planning methodologies (considering the upper catchments, land use and land use changes in the basin, existing and planned water uses and user groups, etc.), in which environmental and social considerations will be key factors. The Water and Energy Commission Secretariat (WECS) will commission a Strategic Environmental and Social Assessment (SESA) under Component B to provide the necessary analysis of critical environmental and social aspects and considerations that need to be integrated into planning decisions for water resource management and hydropower generation at a basin scale (including, for example, decisions regarding location and scale of investments, alternatives, and key mitigation measures). The SESA will also advise on institutional arrangements and processes for ongoing stakeholder involvement for basin management and monitoring. The outputs of the SESA will inform the actual planning processes to be carried out for the pilot basins selected.

40. The activity to propose measures for streamlining of forest clearance process, another of the activities under component B, will not compromise forest habitat protections and it will be ensured that the proposed measures for streamlining the process of forest clearance will be consistent with World Bank OP 4.36 (Forests) and OP 4.04 (Natural Habitats). The streamlined process of forest clearance will be developed under the leadership of forest agencies and in close consultation with stakeholders in the forest and wildlife sectors. The Human development
component will also consider supporting development of professionals that can provide biodiversity baseline and monitoring services to hydropower and linear infrastructure projects.

41. **Studies and activities under Component C.** This component specifically focuses on improving the environmental and social safeguard management system and associated capacity building of key agencies in GoN responsible for power development, especially hydropower. The studies, policy development activities and capacity building initiatives themselves will draw from World Bank safeguard policy standards as well as related and emerging international good practices in the targeted areas (i.e., cumulative/strategic impact assessment, ecological flows, hydropower resettlement and benefit sharing, gender equity, integrating climate change and disaster risk management aspects into hydropower planning, basin planning, and NEA corporate policy for compensation of transmission line ROW). The activities under this component are thus expected to be highly beneficial from a social and environmental perspective, by equipping GoN to develop its hydropower potential in a more sustainable manner at a sectoral level. Component C will also contribute to basin level consideration and coordination with other infrastructure, particularly linear infrastructure (roads, power transmission line) and land-uses to avoid and minimize adverse impacts including resettlement footprints and reduce RoW expenditures.

**F. Institutional and monitoring arrangements**

42. The overall project will be managed by their respective Project Management Units (PMUs). The technical work will be contracted and overseen by the following specific agencies within GoN-NEA will be responsible for the studies for specific investments under Component A; WECS will be responsible for the studies under Component B including integrated basin planning; and DOED will be responsible for the studies and capacity building activities under Component C. Component B and C will be further coordinated by a high level central Project Steering Committee, reporting directly to the Energy Secretary.

**Public consultations and brief description of the Communications Strategy**

Table 2 below presents the public consultation and disclosure approach for the project. This section also summarizes the approach for each component.

43. For Component A, for each investment being prepared under the TA, consultations on the environmental and social aspects of the investments are required with diverse stakeholders – including potentially affected peoples and communities, other local communities as well as NGOs, institutions, industry, academics and any others – at least twice, once at the TOR stage for each investment and once on the draft studies, in accordance with OP 4.01. However, following international good practice, the investment-specific studies to be commissioned will include a more comprehensive stakeholder engagement program.

44. Therefore, this ESMF hereby specifies that each investment specific ESIA TOR shall include a requirement for stakeholder identification and mapping process and development of stakeholder consultation plans for purposes of ensuring effective, inclusive, and culturally appropriate consultation and engagement throughout the course of study of each specific investment. The arrangements for consultation and disclosure of specific investments under Component A are summarized in Table 2 further below.

45. In the case of UAHEP and IKHP, the first formal consultation event was held on the initial draft TORs for the ESIAAs and social planning studies to be carried out for these investments as part of preparation of this TA project, and the TORs (attached in Annex A) have been updated by NEA to reflect feedback received. The minutes of this consultation event are provided in Annex B.
If the proposed transmission line investment is screened to be of a Category “A” nature as per OP 4.01, the draft TOR for the environmental and social studies for this investment will also be disclosed and subject to public consultation prior to its finalization. Furthermore, NEA has established a project-specific website linked to NEA’s Corporate website, where information about the specific investments being prepared under the project (for now covering UAHEP and IKHP) can be accessed.

46. Draft and final reports will need to be disclosed both on the website as well as locally in hard copy, including executive summaries in Nepali and tailored to the language, level of literacy, as well as cultural considerations for the local communities in each project affected area. For the transmission line project to be identified during implementation, similar processes will be followed. In accordance with the Bank’s Access to Information Policy, the studies for each investment will also be disclosed on the World Bank Infoshop website.

47. The need for timely implementation of the project activities, effective grievance redressal mechanism, prompt addressing of the conflicts, timely disclosure of the safeguard documents and dissemination of correct information, and regular/continuous consultations with the local and affected people are some of the lessons learnt from the implementation of the Bank-financed Khimti-Dhalkebar 220kV Transmission line (power sector project) which is currently under World Bank inspection panel investigation. These on site experiences thus also need to be carefully assessed and analyzed and incorporated in the ESIsAs for each proposed future investment, to avoid the repetition of similar errors in project planning.

48. For Component B, with respect to the integrated basin planning activity, consultations started during the preparation of this project, which included an initial workshop in Kathmandu in September 2014 involving key stakeholders from across government and the donor community, as well as select key NGOs and academics. The workshop aimed to lay the initial groundwork for advancing integrated basin planning and management in Nepal at a national level by creating a mutual broad understanding of the key elements and components of such processes, stimulating consensus on the need for such an approach, exchanging information about current and planned donor supported activities in Nepal related to water resource management and planning, and identifying critical gaps or areas where more donor support would be helpful to advancing integrated basin planning.

49. During implementation of the proposed project, this initial workshop will be built upon further with additional capacity building activities involving diverse stakeholders at the level of the specific basins to be targeted through this TA project.

50. The SESA to be carried out in conjunction with the integrated river basin planning activity will furthermore require engagement with broad stakeholders, and will feed the recommendations and feedback of stakeholders on water resource management and hydropower development considerations within each basin into the basin planning processes.

51. The program to be supported through Component B furthermore aims to support WECS in developing a transparent digital platform for data and information sharing at a basin level, to facilitate better understanding of the interrelated effects of different water resource development activities within a basin on shared resources, and hence better decision making and collaborative management of water resources for both hydropower as well as other sector uses (in particular irrigation). All draft and final documents produced related to the integrated basin planning processes will furthermore be disclosed on the digital platform, and linked to from the project website. In accordance with the Bank’s Access to Information Policy, the SESA will also be disclosed on the World Bank Infoshop website.
52. For Component C, the specific studies to be supported related updating of environmental and social regulations and procedures for hydropower will each require identification of relevant stakeholders at the national level, including public, private and civil society sectors, to contribute to each, and engagement with them throughout the course of study so that their inputs and perspectives are considered. Such a consultation is important in achieving the goals of facilitating the investments and safeguarding the environment and society. Stakeholder engagement also provides private developers and government with an understanding of the expectations different social sectors have in regard to hydropower development. All draft and final studies will also be disclosed by DOED.

53. For the overall project, this ESMF outlining the safeguards compliance strategy, requirements and processes across all project components, and including the detailed TORs for environmental and social assessments and studies for the UAHEP and IKHP investments, has been disclosed and consulted with project stakeholders by NEA on behalf of the GoN at a workshop in Kathmandu on December 23, 2014. This ESMF as well as all supporting materials are also available at http://www.nea.org.np/, and all future studies will be disclosed as well at the project website at http://www.nea.org.np/publications.html.

54. Summary minutes of consultations of this ESMF, and the previous consultations on the TORs for the ESIA, CIA and social planning studies for UAHEP and IKHP, are contained in Annexes B and C.

**G. Budget Arrangements for Safeguards Management**

55. Financing is included under the project for all safeguards related studies and specialist advisors as set out above. The table below shows the breakdown of project activities and cost estimations, component by component

Annex A: Terms of Reference for the ESIA, CIA and Social Planning Studies for IKHP and UAHEP
Nepal: Upper Arun and Ikhuwa Khola Hydroelectric Projects

Terms of Reference

Environmental and Social Impact Assessment, Cumulative Impact Assessment, and Social Planning Studies

Background

1. The World Bank is providing financial support to the Government of Nepal, Ministry of Energy, through the Nepal Electricity Authority (NEA), to carry out environmental and social assessment detailed design studies, and preparation of bidding documents for the proposed Upper Arun Hydroelectric Project (UAHP) and the supporting Ikhuwa Khola Hydroelectric Project (IKHP).

2. National power shortage context. Nepal faces a significant and growing gap between power demand and supply. While 75 percent of the population of Nepal is estimated to have access to electricity (grid and off-grid) according to the 2013 census, they do not necessarily have service due to shortage of supply, with load shedding of up to 18 hours per day in grid-covered areas in the dry season. Average annual consumption in Nepal remains very low at about 70kWh per capita, compared to 733 kWh in India and 2,600 kWh in China. The current total installed capacity of the Integrated Nepal Power System (INPS) is 766 MW, and power demand is growing at a rate of 10% a year.

3. The Nepal Electricity Authority (NEA). The NEA is tasked with generating, transmitting, and distributing adequate, reliable, and affordable power by planning, constructing, operating, and maintaining all generation, transmission, and distribution facilities in Nepal’s power system, both interconnected and isolated. NEA was formed in August 1985, under the Nepal Electricity Authority Act of 1984, as a vertically-integrated government-owned utility responsible for generation, transmission, and distribution of electricity in Nepal. NEA generates approximately 60 percent of the current electricity output in Nepal. Independent Power Producers (IPPs) also invest, own, and operate power generation facilities, mostly based on hydro resources. However, as the owner and operator of the national grid, NEA serves as the single buyer for the IPP-generated electricity for domestic grid-based electricity supply. NEA’s Board of Directors is chaired by the Minister of Energy, and consists of representatives from the Ministry of Energy; Ministry of Finance; the industry, commerce, and financial sector; the consumer pool; and the non-government power sector.

4. To meet the increasing power demand, NEA is prioritizing the development of a suite of proposed hydropower projects, among which the 335MW UAHP is a high priority due to its expected low generation cost and high availability of firm power. The ultimate purpose of power generation is to increase domestic energy supply through the national grid; in the future, surplus energy maybe exported. NEA is also responsible for the planning and implementation of the IKHP. A list of other projects currently at an advanced stage of planning and design by NEA are presented in Annex-1.(The proposed Upper Arun and Ikhuwa Khola projects are not included in the annexed list as they are still in the early stages of design.)
5. **Project planning background.** The proposed UAHP project site was first identified by the Master Plan Study of Koshi River Water Resources Development by JICA in 1985. A subsequent reconnaissance study was conducted by NEA in the summer of 1986. In 1991, a feasibility study of the project was completed on behalf of NEA by a Joint Venture of Morrison Knudsen Corporation, Lahmeyer International, Tokyo Electric Power Services Co., and NEPECON. A preliminary Environmental Assessment was also carried out. NEA intended to develop the UAHP only well after completion of the Arun III Hydropower Project. The two projects are not interdependent, and no specific sequencing is required to ensure the viability of each. After failing to achieve financial closure on Arun III, NEA shifted focus to the development of other hydropower projects outside the Arun Valley. In 2011, in order to meet increasing electricity demands and mitigate load shedding, NEA revisited and reviewed the feasibility study of UAHP and reaffirmed it as a priority project due to its relatively low cost of generation, its availability of high firm energy and potential to contribute to the Integrated Nepal Power System, and its location in the power deficient eastern region of Nepal. The review also identified changes in available infrastructure at and around the project site, and collected additional information contributing towards the detailed engineering design of the project.

6. In February 2013, a cabinet decision granted the NEA permission to implement the UAHP under the ownership of the Government of Nepal. The Department of Electricity Development informed NEA that a Survey License would not need to be issued to NEA since NEA would be implementing the project on behalf of the Government of Nepal. The associated IKHP would be developed under the umbrella of the UAHP, but unlike the UAHP, which is wholly owned by the Government of Nepal, IKHP would have the option of being jointly developed with the participation of the local community. Nonetheless, irrespective of how the two projects are viewed under national law, for purposes of the proposed studies they are being treated in an integrated fashion.

7. **World Bank involvement.** The World Bank is supporting the proposed studies as part of its ongoing engagement with and support to the Government of Nepal in strategic planning and detailed project preparation for priority projects in the hydropower sector. While decisions related to the future financing of the project have not yet been taken, the proposed studies must be carried out in accordance with World Bank Operational Policies including Safeguard Policies and Environmental, Health and Safety (EHS) Guidelines, in addition to applicable national legislation.

**Project components and linked activities**

8. **The Project.** The project components to be covered under this consultancy will include Upper Arun Hydroelectric Project (UAHP), Ikuwa Khola Hydroelectric Project (IKHP), various ancillary activities related to each hydroelectric component, and the required transmission lines. These are described below and referred to collectively thereafter as “the Project,” unless otherwise specified.

9. **Upper Arun Hydroelectric Project (UAHP).** The UAHP is a proposed 335 MW hydroelectric facility to be located on the Arun River in Sankhuasabha District of eastern Nepal. The project area is situated within Longitude $87^\circ 20'00"$ to $87^\circ 30'00"$ East and Latitude $27^\circ 38'24"$ to $27^\circ 48'09"$ North, about 15km south of the international border with Tibet and 220 km east of Kathmandu (see Annex 2). The proposed dam site is located in the Chepuwa Village, in a narrow gorge about 350m upstream of the Arun River’s confluence with the Chepuwa River. The proposed power plant site is located in the Hatiya Village 16km downstream of the dam site, near the Arun River’s confluence with the Leksuwa River. The right bank of the Arun River at the proposed UAHP site falls within the Makalu Barun Buffer...
Zone, which is adjacent to the Makalu Barun National Park. The proposed UAHP dam site is therefore located at the edge of the Buffer Zone. UAHP is the upstream most of the three major hydropower projects currently identified and under preparation in the Arun Basin, the other two being the 900 MW Arun III project and the 300 MW Lower Arun project, both of which are more advanced in their preparation status and have already been licensed to IPPs (see Annex 3). These three projects are functionally interdependent from each other and do not require any specific sequencing or coordination in their development in order to be viable. Nonetheless, all three projects may share a common transmission line to evacuate power to the nearest load center in Terai (about 150 km from the UAHP site). The process for finalizing decisions about alignment and development of the transmission line is discussed further in paragraph 13 below.

10. **UAHP salient features.** As informed by an initial feasibility study completed in 1991, the proposed UAHP is designed to be a Peaking Run of the River (PRoR) project with gated weir across the Arun River. Intakes on the left bank of the river are proposed to divert the design discharge of 78.8 m$^3$/s through an intake tunnel to three underground desanding basins, a headrace tunnel of 7.8 km, surge tank, drop shaft, pressure tunnel, and ultimately to the underground powerhouse for power generation. Water would be retained for a period of a few hours only in a peaking pond and then released through the tunnel during peak hours. After power generation, water will be released back to the Arun River (see Annex 4). A capacity optimization study in 2011 established the proposed UAHP’s capacity of 335 MW and annual energy generation of 2598 GWh. The salient features of the proposed project as informed by the initial feasibility study are listed in Annex 5. NEA will be assisted by an international engineering consulting firm, being contracted in parallel to the consultancy described in these TOR, to inform the final decisions about siting and design of these salient features. NEA will facilitate coordination across the consulting teams to ensure that the inputs from the environmental and social assessment and planning studies described in these TOR feed into these final siting and design decisions.

11. **Ikhuwa Khola Hydroelectric Project (IKHP).** NEA has also proposed to develop the 18 MW IKHP, a medium sized hydropower project, in tandem with the UAHP. The proposed IKHP site is located on a tributary to the Arun River approximately 8 km downstream of the proposed UAHP powerhouse site, and 5 km upstream of the proposed Arun III Hydropower Project headworks (see Annex 6). The IKHP project is envisioned to provide a source of benefit sharing and also power supply to local communities, and may be jointly developed with the participation of the local community. The Department of Electricity Development (DoED) of the Government of Nepal plans to complete a feasibility study and an initial environmental examination (IEE) for IKHP in 2014.

12. **Site access.** The proposed UAHP and IKHP sites are not presently accessible by motorable road. The closest point of road access is Num Bazaar, which is close to the proposed dam site of Arun III Hydropower Project. Num Bazaar can be reached from Kathmandu by taking a flight to Tumlingtar, then driving approximately 15km on an all season road to Khadbari, followed by approximately 40km on a fair weather road. The fair weather stretch is planned to be upgraded to an all season road. Road access from Num Bazaar to the proposed UAHP and IKHP sites is then planned as follows:

   a. **Num-Kimathanka Access Road:** The Department of Roads of the Government of Nepal is currently constructing the fair-weather North-South Koshi Road, which will connect Nepal to the Chinese border at Kimathanka. The proposed northward extension will connect Num to Digha via Barun Bazaar. It will extend along the right bank of the Arun River, passing very close to the proposed UAHP powerhouse.
b. **UAHP Project Access Road:** To connect the UAHP powerhouse with the dam site, the project will require building of a dedicated access road of approximately 23.4 km, including an estimated 1.7 km of road tunnel and a bridge over the Arun River (see Annex 7). The proposed route would initiate from the Num-Kimanthanka Road between Gola and Barun Bazaar, at a location approximately 24 km from Num. The proposed alignment is based on the UAHP feasibility study; however, the environmental and social assessment process to be carried out through this consultancy will evaluate and propose potential adjustments to the alignment to minimize negative impacts.

c. **IKHP Access Road:** The length and route of any additional access road required to reach the IKHP project site is not yet determined, as the feasibility study for this project is still underway.

13. **Power transmission.** A power evacuation study for the UAHP and IKHP projects has not yet been carried out. The current proposed option by NEA is to use the proposed Koshi Corridor transmission line up to Khadbari, being financed by Indian EXIM bank, and NEA will extend 220 kV line with length of 45 km to UAHP site. The detailed engineering design study for the UAHP project will evaluate this and any other options to connect to the national grid to inform a final decision on both alignment and design. The final decision will depend in part on decisions related to power evacuation for the Arun III and Lower Arun projects. While the two IPPs for these projects have signaled a preference to let GoN construct the transmission line for all three projects and to pay wheeling charges to the GoN to make use of the line, they may decide to finance and build at least the lower portion of the line themselves depending on the GoN’s expected delivery timeline vis-à-vis their own project development timelines. A lower voltage transmission line will meanwhile be constructed to connect the IKHP powerhouse to the local grid to supply energy to the local communities. Final decisions regarding the route for the IKHP’s transmission line will be determined during detailed design of that component.

14. **Ancillary works and other possible linked activities.** Various ancillary works will be required for project implementation, including contractor camps, diesel generators for construction-stage power supply, spoil and waste rock disposal areas, borrow areas, NEA staff housing, etc. These, and any other activities associated with the project that could be considered “linked activities” as defined in World Bank OP 4.12 (Para 4) – e.g., activities which are directly related, necessary to achieve the Project objectives, and planned to be carried out contemporaneously – shall also be covered under this assignment. The Consultant will consult and discuss with NEA and World Bank to identify all such linked activities under the screening and scoping stage of the consultancy (Part 1, as outlined below).

**Objectives of this Consultancy**

15. The objective is to conduct and complete environmental and social impact assessment with associated environmental and social management plans, as well as planning and design for the Project in accordance with relevant laws and policies of the Government of Nepal (GoN) and the safeguard policies of the World Bank.³

³The Consultant is also encouraged to consider other relevant international standards including those of other international financial institutions, export credit agencies, and private sector investors (e.g., IFC Performance Standards, International Hydropower Association Sustainability Guidelines, Equator Principles etc.), and reference applicable aspects of those standards in the assessment process when they are more stringent.
16. The Consultant shall ensure that all positive and adverse impacts associated with construction and operation of the Project, including all associated/ancillary works and linked activities if any, are taken into account. Specific objectives of the consultancy include:

- To carry out site investigations to collect primary data and review all available relevant secondary data to establish a comprehensive environmental and social baseline (including physical, biological, social, cultural and economic environments) for the Project Area of Influence;
- To screen, identify and assess potential positive and adverse environmental and social impacts, including direct, indirect, and induced and environmental and social impacts associated with all Project activities, as well as cumulative impacts of the Project when taken together with impacts associated with the Arun III, Lower Arun and other development projects (hydropower, power transmission, or otherwise) planned or underway in the Arun River basin;
- To develop proposed measures to avoid, reduce, mitigate, manage and/or compensate for such impacts, including the institutional arrangements and required capacity building to implement all such measures and monitor their effectiveness;
- To identify potential opportunities and design appropriate measures to maximize complementary economic, financial, environmental and social benefits of the Project;
- To ensure that all affected people receive assistance to enable them to improve or retain their pre-Project living standards and be able to participate and share the benefits of the development;
- To ensure that impacts on vulnerable and indigenous communities are avoided, minimized, mitigated and/or compensated, and that mechanisms are designed to ensure their meaningful participation during Project planning and implementation, and that they receive culturally appropriate benefits under the Project;
- To confirm that the Project enjoys broad support from indigenous communities through free, prior and informed consultation;
- To conduct a public consultation process that ensures that Project affected people and other stakeholders are informed about the Project and its possible impacts, as well as offered the opportunity to share their opinions and feedback so as to input into these environmental and social assessment, planning and design studies and their implementation; and
- To document all of the above mitigation and development interventions in appropriate forms and formats to be further discussed and agreed upon with NEA and in line with World Bank standards.

17. The Consultant shall carry out this assignment by reviewing and drawing from information collected under previously conducted studies, supplementing it through additional literature research and field data collection and planning activities that would vary across the different assignment tasks. The Consultant shall validate and report on the quantity and quality of the available data.

18. The Consultant shall ensure that the environmental and social assessment, planning and design outputs of this assignment will comply with and meet the legal and technical requirements of the Government of Nepal and World Bank environmental and social policies. This assignment is considered complete only upon approval and clearance of the final versions of the required environmental and social assessment and planning documents by the Government of Nepal, with concurrence from the World Bank.

19. Given the size and complexity of the Project and its potential impacts, in accordance with World Bank Safeguard Policies, an Independent Panel of Experts (IPOE) will also be
contracted separately by NEA to provide guidance throughout the environmental and social assessment and planning process. The Consultant’s draft and final deliverables will thus also be subject to review by the IPOE, as part of the Government’s review and approvals process.

**Scope of Services**

20. The assignment will be carried out in synchronization with the engineering design assignments for the Project, which will be contracted separately. NEA will facilitate the interaction between the Environmental and Social Consultant (hereafter, “the Consultant”) and the Engineering Design Consultant. The two consulting firms shall be expected to interact and share data, analyses and recommendations as relevant to the other’s assignment in a timely manner.

21. The tasks covered are preliminary, and aim to provide overview of the Project and studies to be conducted under this assignment. The Consultant shall develop site specific ToR for ESIA to be completed following the procedure of Scoping as outlined below and in accordance with Environment Protection Rules (EPR) 1997 of Government of Nepal and World Bank Environmental and Social Safeguard Policies. The Consultant shall conduct the ESIA and other environmental and social assessment and planning studies based on the ToR cleared by the World Bank and approved by the Ministry of Science, Technology and Environment (MoSTE). Prior to conducting TOR or ESIA studies, the consultant will seek initial approval from the Ministry of Forest and Soil Conservation (MoFSC). Prior approval and consent from the MoFSC is mandatory as per the secretary-level decision made by the Government of Nepal.

**Task 1: Environmental and Social Screening and Scoping**

22. As a first task, the Consultant is expected to identify the Project’s salient environmental and social aspects and potential impacts to be studied in more detail, verify the scope of the detailed studies to be undertaken, carry out initial public consultations, and develop detailed a work plan to carry out the studies. The specific subtasks are outlined below:

   a. *Review of all available existing information* on social and environmental baseline conditions and potential impacts related to UAHP, IKHP, and associated and linked activities and projects, including transmission line(s) and access road(s), as well as other ongoing or planned projects and activities in the watershed, in particular the other hydropower projects planned for the same basin, as well as other economically productive activities carried out within the region/basin including agricultural production, manufacturing, and tourism. Several previously conducted studies will be made available by NEA – see Annex 8 for an initial list. The Consultant will also be responsible for identifying any other existing studies or data of relevance to the assignment.

   b. In accordance with the requirements of the EPR, the VDCs, institutions and communities in the Project area shall be notified about the environmental and social scoping through a public notice. The Consultant shall publish a Scoping notice in national daily newspaper mentioning the ongoing ESIA of the Project with a brief description of the Project and activities, a list of districts and VDCs likely to be affected by Project, the impact areas, request for comments and suggestions along with address of communication. The copy of notice shall be displayed in all Project-affected VDCs and
a muchulka (signature of witnesses) confirming the display of the public notice shall be prepared.

c. Carry out an initial site visit including formal and informal discussions / meetings with local communities, government entities and other key stakeholders, in order to ground truth the information reviewed from existing sources about the Project’s social and environmental context, complete an initial screening of likely environmental and social impacts and sensitivities, and enable logistical planning of additional required fieldwork to complete the full analyses and plans.

d. Develop a detailed Project description encompassing both UAHP and IKHP for purposes of the ESIAs for each as well as other required environmental and social studies. The Project description would be based on descriptions developed under the feasibility analyses for each hydroelectric component and their major ancillaries, but should synthesize and provide an integrated overview of all key aspects of relevance to the proposed studies. This would include, for example: location of each hydroelectric component and their energy generation capacity; Project components for each and their basic design, including all ancillary aspects (e.g., dam and reservoir, diversion tunnels and powerhouse, power transmission lines, access roads and tracks, resettlement sites, borrow and disposal areas, construction camps, etc.); time-sequenced explanation of primary activities to be carried out during pre-construction, construction, operation and maintenance; indication of support facilities and services required including any required off-site investments; life span of the investments.

e. Define and describe the Project’s Area of Influence, based upon the area likely to be affected either directly or indirectly by each component, including ancillaries and linked activities; as well as unplanned induced developments (for example, spontaneous settlement, logging, land clearing along access roads, etc.). The Area of Influence should include, for example: (a) the direct footprint of all Project components; (b) off-site areas required for resettlement or compensatory tracts; (c) the air shed (e.g., where the impacts of blasting activities, exhaust or dust may be felt); (d) the Arun River watershed, including tributaries, forests and other areas which may be either directly impacted or which have demonstrable ecological or social connectivity to the directly affected areas; (d) human and aquatic and terrestrial habitats, as well as migratory routes of humans and of terrestrial and riverine flora and fauna, particularly where they relate to public health, economic activities, or environmental conservation; and (e) areas used for livelihood activities (hunting, fishing, grazing, gathering, agriculture, etc.) or religious or ceremonial purposes of a customary nature which may be affected by the Project. The Area of Influence should also consider any transboundary implications of the Project activities or linked/associated investments.

f. Through desk reviews and field screening and verification, identify and describe the Project’s Environmental and Social Impact Zones, which would form a subset of the total Project Area of Influence and should cover the areas directly affected by all civil works planned under the Project, as well as those activities that are not financed by the Project but considered as “linked” as described in paragraph 14 above. This is an initial and general assessment and will provide a basis for the development of the social planning task (Task 3 below). Develop a matrix to document i) identified Environmental and Social Impact Zones against civil works activities, ii) identified categories/kinds of social impacts, including direct physical impacts and the impacted population, and iii) a preliminary assessment of the expected degree of impacts (scale and severity).
g. Prepare a detailed Scoping Report, to consist of the following components:

i. Initial Project description and definition of overall Project Area of Influence (including Environmental and Social Impact Zones);

ii. Summary of findings on the key social and environmental baseline aspects and potential impacts, including an indicative assessment of scale and severity, which should be included for further study in the environmental and social assessment and planning studies (to incorporate the social impact matrix as described above);

iii. Confirmation on the applicable World Bank safeguard policies as well as EPR 1997 and other national standards and regulations which apply to the Project (such as Solid Waste Management Act, Local Self Government Acts, etc.), broken down by the Project’s major components;

iv. Draft TORs / outlines of each of the environmental and social assessment and planning studies to be undertaken based on the issues identified during scoping process.

h. The format of the report should include both a write-up as well as a summary presentation to use in the first round of formal stakeholder consultations.

23. Stakeholder consultation strategy for the planning phase, and initial consultations. Given the high profile and the history of hydropower development in Nepal, stakeholder engagement and consultations needs to start early as part of the planning process. Following incorporation of feedback on the draft Scoping Report provided by NEA and the World Bank, the Consultant will:

a. Conduct VDC level stakeholder consultation meetings in each Project affected VDC to discuss the findings of the Scoping, major issues of the project and plan of the studies. Similar consultation shall be made with Buffer Zone Management Authority and Makalu Barun National Park Authority. The comments and suggestions received from the participants shall be collected and incorporated in Scoping and ToR documents.

b. Conduct district level stakeholder meeting to discuss the findings of the Scoping, major issues of the Project, and plan of the studies. The key stakeholder like District Forest Office, District Development Committee Office, District Administration Office, District Education Office and District Agriculture Development Office, local NGOs working in the area, shall be invited for the meeting. The Consultant shall make a brief presentation of the findings of the Scoping, key environmental and social issues of the Project and plan of the ESIA and other environmental and social planning studies. The comments and suggestions received from the participants shall be collected and incorporated in Scoping and ToR documents.

c. Conduct Central Level workshop to present the findings of the Scoping to the key stakeholder who directly or indirectly influence the Project development. The participants of the central workshop will be almost same as proposed for upcoming workshop.

d. Develop a stakeholder consultation strategy and action plan to be adopted for the planning phase. This strategy will be further developed later into a full project consultation strategy, as part of the Public Participation and Consultation Plan outlined under Task 3 below.

e. Carry out and document a round of scoping-stage stakeholder consultations on the contents of the Scoping Report, in particular the initial Project description and proposed
Area of Influence, findings of environmental and social screening, and the draft TORs / outlines for the proposed studies.

24. Finalization of Scoping report and ToR document and development of work plan. Based on feedback received during the consultations, the Consultant shall revise and finalize the contents of the Scoping Report, and ToR document and develop a detailed work plan for carrying out the assessments and studies as outlined. The revised Scoping Report and ToR document shall be submitted to NEA along with documentation of the consultations carried out, including information on who attended, a summary of issues raised, and how they have been considered. NEA and World Bank will review the documents and provide their comments and suggestions. The Consultant shall incorporate the comments and submit the documents to NEA for the approval of Ministry of Environment. The Consultant will make presentation on the Scoping and Terms of Reference document to Ministry of Environment and submit revised documents to NEA incorporating the comments of ministry. NEA will forward the revised document to Ministry of Environment for the approval.

25. Key expected outputs of Task 1: (a) ESIA Scoping document covering the project description, definition of Project Area of Influence, and description of Environmental and Social Impact Zones, and environmental and social issues. (b) ESIA TOR / outlines for each environmental and social assessment and planning study to be carried out under subsequent tasks of the consultancy, reflecting the feedback received from stakeholder consultations as well as NEA, the World Bank, and the International Panel of Experts, and submitted for approval by MoSTE and MoFSC. (c) A detailed work plan for carrying out the assessments.

Task 2: Environmental Assessment and Planning

26. Once approval of the detailed assessment TORs has been received from MoSTE and MoFSC, the Consultant shall develop one or more Environmental and Social Impact Assessment (ESIA) reports, including Executive Summary (and related public consultation materials), for the Project. The final decision on how the assessment and management planning results should be presented – e.g., as one single ESIA for the Project, vs. two separate ESIAs for the two hydroelectric components of the Project and their respective associated, ancillary and linked activities – will be made at the screening and scoping stage of this assignment (e.g., Task 1). Regardless, the process should include the key elements outlined below, and also shall ensure consistency with World Bank requirements for Environmental Assessment as per World Bank OP 4.01 Annex A (see Annex 10), as well as the Government of Nepal EPR requirements for EIA. The resulting deliverables shall also include a single unified Executive Summary (to be available in both English and Nepali), as well as a single integrated Cumulative Impact Analysis, as outlined further below.

27. In addition to environmental aspects, the study or studies shall incorporate social baseline, impact assessment, and management information, the key aspects of which are described in more detail in Task 3 of this phase of the consultancy, such that the final deliverables present an integrated assessment of both environmental and social aspects of the proposed Project activities. While social and environmental components of this overall consultancy are presented separately in these TOR, the multi-disciplinary Consulting team is expected to work collaboratively to ensure holistic analysis of social and environmental project impacts (for example, in assigning significance to environmental impacts in light of the socioeconomic or cultural value of the affected resource), as well as to capture and assess potential secondary effects of proposed mitigation measures (such as environmental impacts...
associated with project resettlement, or socioeconomic impacts associated with proposed
environmental conservation and offset programs, etc.) For specific social aspects which are
expected to produce their own stand-alone planning documents as outlined in Task 3 below,
the integrated ESIA(s) shall summarize relevant aspects of these more detailed studies. In
addition, any other relevant social impact and management aspects identified in the final
approved version of the ESIA ToR (output from Task 1 of consultancy) should be covered.
The entire scope of work under this task shall be covered in the ToR and the ESIA shall be
conducted based on the approved ToR.

28. **Baseline studies.** To underpin the ESIA(s) and additional studies as outlined in these terms of
reference, the Consultant shall assemble, evaluate, and present baseline data on all relevant
environmental and social characteristics of the full Area of Influence, including data collected
from primary (field) and secondary sources, spanning physical, biological (both aquatic and
terrestrial), socioeconomic, health, political, ethnic, and cultural aspects. Some information
may already be available from the feasibility studies and previous environmental studies, but
may need to be updated. The Consultant should evaluate the methodologies used as well as
graphic and temporal coverage of past fieldwork and, where deemed insufficient to meet
international standards, should carry out additional fieldwork to fill in gaps. Full scoping of
the baseline studies will be formulated during the screening and scoping phase of the
consultancy (Task 1) with a view to focusing on the most relevant and important aspects;
nonetheless, key aspects are presumed likely to encompass the following (for each
hydropower component):

a. **Physical context, including:**

i. *Hydrology:* Describe the extent and characteristics of the catchment area of the
Project in relation to the larger watershed. Map the surface hydrology and the
current flow regimes of the Arun River, its tributaries and other water bodies as
applicable in the Area of Influence, showing its context within the full
watershed, and transboundary aspects. Describe location and characteristics of
glacial lakes and snowpack distribution in relation to surface hydrology.
Include characterization of groundwater in the region. The baseline should
provide information on discharge (mean monthly, maximum, minimum) at the
proposed dam sites along with locations upstream and downstream, and capture
seasonal variations in flow, based on at minimum one full year’s worth of field
monitoring results (and more if available). Include estimated flood stream
flows for annual average and highest historic flows at the proposed dam sites
and at townships and other populated areas along the river. Also include
probable maximum flood (PMF) flows, clearly describing assumptions made in
the estimation, at the proposed dam sites and the powerhouse sites. The flow
parameters (discharge/velocity/water depth) in reduced flow section associated
with minimum monthly average flow and proposed downstream release shall
be provided.

ii. *Soils, sediment movement, sedimentation, and erosion:* Include a
characterization of soil types, locations and qualities. Characterize erosion rates
in the project area, noting the corresponding geological conditions, slope
steepness, vegetation type, and present land-use conditions. Describe the
dynamics of sediment movement in the watershed, along with seasonal
variations in the estimated amounts of suspended sediments and bed load
presently transported past the dam sites. Also include a baseline for any
potential “pollutant” in sediments during construction and operational phases
of the Project.
iii. **Water quality**: Describe the baseline water quality of the Arun River, its tributaries, and other water bodies in the Project Area of Influence in terms of parameters relevant to public health and aquatic resources (e.g., biota, biodiversity, and habitat). Include seasonal variations in water quality and relationships to flow and other controlling factors. Water quality parameters of Arun River shall be measured at least for headworks, reduced flow zone and powerhouse tailrace area.

iv. **Geology, geomorphology, and seismology**: Cover, in particular, the presence or absence of sulfides or heavy metals in subsurface and surface rock in the areas where blasting and tunnel drilling will occur (which could result in acid rock drainage or other waste management issues associated with waste rock disposal); and characterize faults and overall seismic activity in the region which could affect or influence design, construction and maintenance aspects of the dams and other project infrastructure. Characteristics of discontinuities and weathering patterns of the rock mass along the tunnel alignment, continuity, roughness, attitudes, aperture, ground water condition and rock mass quality shall be provided.

v. **Landslide and other natural hazard propensity**: Describe the natural phenomena that pose potential risk to the project including Glacial Lake Outbursts (GLOFs), Landslide Dambreak Failure Floods (LDFFs), very high river flows which result from sustained rainfall in the watershed upstream of the site, incremental “mass wasting,” as well as possible extreme events.

vi. **Climate change**: Characterize anticipated climate change effects to the region and their expected impacts to river hydrology and flow rates, flood profiles (including the potential for GLOFs and LDFFs, as well as changes to the probable maximum flood profile), as well as their potential ecological effects. Include discussion of climate change impacts on upstream glacial hydrology and water supply to the basin; on water demand relative to supply in the Area of Influence; on soil movement and mass wasting; on dam/power house safety; as well as on forest, pasture, and agricultural land composition and use.

vii. **Physical cultural resources**: Carry out field reconnaissance, review of literature, and interviews / questionnaires with key stakeholders (including relevant government bodies, academics, NGOs, local religious leaders and elders, etc.) to identify and characterize any sites, structures, or natural features and landscapes in the Project Area of Influence – above ground, underground, or underwater – that are of archaeological, paleontological, historical, architectural, religious, aesthetic, or other cultural significance. Indicate whether any identified cultural resources are subject to special treatment under national law. Indicate the likelihood of “chance finds” during project construction, and the presumed typologies of such finds.

b. **Biological context, including:**

i. **Aquatic ecology**: A detailed characterization of aquatic flora, fauna and natural habitats based on full seasonal field data, secondary information, as well as interviews with local residents. This would include, in particular: migratory and endemic species (including any applicable conservation or protection status, and IUCN Red List status), economically or culturally important species, and others which play important ecological functions as food sources or sustainers of the habitat of identified key species. Characterization of
migratory patterns, including length and season of migrations (in both tributaries and mainstream river, as applicable), as well as spawning locations and habits should be included. The study should cover not just the Arun River, but also tributaries and other water bodies in the Area of Influence.

ii. **Terrestrial ecology:** A detailed characterization of terrestrial flora, fauna and natural habitats based on full seasonal field data, secondary information, as well as interviews with local residents. This would include, in particular: migratory and endemic species (including any applicable conservation or protection status, and IUCN Red List status), economically or culturally important species, and others which play important ecological functions as food sources or sustainers of the habitat of identified key species. The multiple bio-climatic zones along the slopes of the valley should be characterized, including the interaction of species within the various zones, and areas of importance as corridors for wildlife movement throughout the region. For avifauna, the baseline should in particular make note of any migratory flyways or Important Bird Areas (IBAs), and also characterize species which may be particularly susceptible to impacts from project activities and infrastructure (due to, for example, their propensity for perching, roosting, and/or nesting on power transmission lines, poles, or towers; physical characteristics or behaviors which could increase risk of collision, etc.).

iii. **Natural habitats:** The UAHP dam site is located at the edge of the Makalu Barun Buffer Zone, which abuts the Makalu Barun National Park. Some of the Project’s direct footprint is thus expected to fall within the Buffer Zone. The overall Area of Influence of the Project will include areas of the Buffer Zone, and may also include areas of the adjacent Makalu Barun National Park. For both aquatic and terrestrial habitat, the baseline should include a determination on the presence of critical natural habitat as defined by World Bank OP 4.04. All areas of critical natural habitat identified should be fully characterized, including their legal conservation status and administration and any relevant land or resource use restrictions. For legally protected areas, the capacity of entities responsible for its management should be assessed. This would include the Makalu Barun National Park and Buffer Zone, but may also include other areas to be determined by the Consultant.

c. **Socioeconomic, cultural and health context, including:**

i. **Water use and users:** Identify all existing water uses, including both permitted and non-permitted, for the Arun river, its tributaries, and other water bodies in the Project Area of Influence, such as for irrigation, domestic consumption, industry (if any), recreation, etc. Identify the user groups for each.

ii. **Land use:** Characterize current land uses in the project area and indicate major trends in land use change which are taking place irrespective of the proposed project. This process should include remote sensing through current satellite imagery and ground verification for preparation of thematic forest-cover and

---

4 Critical natural habitats are defined by World Bank Operational Policy 4.04, Annex A to include existing protected areas and areas officially proposed by governments as protected areas (e.g., reserves that meet the criteria of the IUCN classifications); areas initially recognized as protected by traditional local communities (e.g., sacred groves); sites that maintain conditions vital for the viability of these protected areas; areas with known high suitability for biodiversity conservation; and sites that are critical for rare, vulnerable, migratory or endangered species. Refer to the operational policy for additional guidance.
land-use maps. Land-use change trends should also be considered to understand the dynamics of land-use and recent forest-cover change trends.

iii. **Land tenure:** Characterize types of land tenure (e.g., titles, customary), formal and informal institutions related to land tenureship, and modes of land transactions in the project area (a full land and asset registry for individuals and households to be displaced will be prepared separately as part of the Resettlement Action Plan).

iv. **Demography and ethnicity:** Develop a demographic and ethnic profile of the population in the project area. For communities specifically affected by the project, describe in detail their history, physical spread, social clustering, cultural and traditional characteristics, interactions and relations among various groups.

v. **Livelihood activities:** Characterize economic and subsistence-oriented livelihood activities, both for communities residing within the Project Area of Influence as well as for individuals or industries which depend on resources in the Project Area of Influence. Discuss in particular those activities related to fisheries, forestry or forest products, or other natural resources, as well as agriculture and industry (if any). Discuss gender related work load sharing and family economy; dependency and use of local and external resources; and production and marketing systems and patterns.

vi. **Socioeconomic development status:** Map out the socioeconomic development status of the project area, including resource conditions, economic activities, employment sources and trends, infrastructure and service provision (education, transport, extension services etc.), as well as local development needs, priorities, challenges, and planned or ongoing development interventions. Include a baseline poverty mapping, along with discussion of causes thereof. Develop a socioeconomic baseline for affected communities covering indicators specific to living standard and well-being.

vii. **Community health:** Provide an overview of key health issues, focusing on the presence of any disease vectors which may become more prevalent in the area due to the project (for example, waterborne vectors who inhabit slow-moving or standing water; HIV/AIDS or other sexually transmitted diseases which may become more prevalent due to worker influx, etc.), as well as the coverage and quality of health services available in the project area.

viii. **Indigenous and vulnerable peoples:** Identify the presence of vulnerable and indigenous peoples residing in the project area and compile information on their demographics, socio-cultural features, livelihood and employment patterns, use of natural resources, formal and information institutions, and interactions with other ethnic groups. Discuss social cohesion and leadership institutions. Provide gender-specific information as possible. Any contact or interviews for preparation of baselines or social assessment should be planned and carried out in a culturally appropriate manner, in a language acceptable and

---

5 Refer to World Bank OP 4.10 (*Indigenous Peoples*), para. 4, for the criteria to be used in identifying indigenous peoples and determining the scope of applicability of the World Bank policy.
used by the communities and in coordination with any other preparation work being carried out with regard to Indigenous Peoples.

ix.  Religion and culture: Provide relevant information on community festivals and rituals, in particular those involving the Arun River or its tributaries, or other key resources to be affected by the project.

29. **Environmental and Social Input into Analysis of Project Alternatives.** A feasibility study has been completed for the UAHP, including initial recommendations for detailed engineering design, based on a preliminary alternatives analysis. A similar feasibility study for the IKHP is scheduled to be completed by DOED this Nepalese fiscal year. These studies will be reviewed under the separately contracted Engineering Design assignment, and analyzed in depth against alternative design options— including, for example, alternative siting and/or alignments for the dam (with implications for the total flooded area), tunnels, powerhouse, access roads, etc. – before a final selection is made and detailed engineering design starts. As part of the Environmental and Social Impact Assessment process, the Consultant shall carry out a parallel assessment of the environmental and social considerations relevant to the facility siting, alignment and other design alternatives of the UAHP and IKHP components (and their ancillaries) under study, as input into final decisions on the detailed engineering designs for each. Furthermore, the consultant shall review and document previous social and environmental considerations that factored into the Government of Nepal’s strategic decision making process about energy generation options and priorities and basic site selection for the two hydroelectric components.

30. The following tasks will be performed by the Consultant in this regard:
   
   a. Review the feasibility studies of the UAHP and IKHP, and summarize the extent of consideration of environmental and social issues in forming the technical recommendations on aspects such as siting, alignment, design (including peaking power generation type), phasing, and construction techniques for key Project facilities.
   
   b. In tandem with the more in-depth review of feasible engineering design alternatives (including siting, alignment, phasing and construction techniques for key Project facilities and their associated or ancillary works), to be carried out in parallel to this consultancy by the Engineering Design Consultant, assess the environmental and social impacts (positive and negative) for each design alternative under analysis. NEA will ensure that the Engineering Design Consultant provides relevant information on the design alternatives under consideration to the Environmental and Social Consultant.
   
   c. Share and discuss the assessment findings and conclusions with the Engineering Design Consultant, and provide input to the finalization of the design alternatives analysis, including recommendations on the design alternative(s) that best minimize negative environmental and social impacts and maximize positive impacts.

31. The above tasks will be conducted through desk reviews, field verification and consultations with stakeholders, particularly local communities. This will require the Environmental and

---

6It should be noted that access roads in particular have the potential to cause even greater environmental and social impacts than hydropower facilities themselves, particularly for projects in remote areas such as the proposed Project, where new roads may lead to indirect and induced land use changes. The review and analysis should therefore include particular attention to site access options and alternatives considered or under consideration.
Social Consultant to work closely with the Engineering Design Consultant. All consultations shall be documented.

32. In addition, the Consultant shall review the 1985 Master Plan Study of Koshi River Water Resources Development and other energy sector planning documents, as well as interview key government officials, in order to document the social and environmental considerations taken in the government’s analysis of alternative energy sector investments which led to the UAHP and IKHP project concepts. The report to be produced should encompass all available information on the comparative positive and negative environmental and social impacts of feasible alternatives to the Project, in terms of: (a) the “without project” alternative, (b) other potential energy supply sources; and (c) the alternative of energy efficiency improvements, in addition to (d) facility siting, alignment, design, phasing and construction technique alternatives. The report should also describe and include documentation, to the extent available, of public engagement in the government’s process of analyzing these alternatives. Based on the Consultant’s findings, if evidence of meaningful consultations to date on project alternatives is not apparent, the Consultant shall outline an approach and specific plan for further engagement and consultation to be carried out during the course of completion of the environmental and social assessments, and modify the Work Plan accordingly.

33. Impact analysis. Assess all direct, indirect, and induced impacts and risks in both the short-term and the long-term resulting from both construction and operation stage activities of the Project, and propose mitigation measures for each. (Cumulative impacts are discussed separately below.) The analysis should follow an internationally recognized methodology to assign significance levels to each identified impact, both before applying recommended mitigation measures and afterwards (e.g. residual impact). The analysis should also include an inventory of communities that are likely to be affected and differentiate the types and levels of impacts upon different communities. While the full scope of coverage of the impact analysis will be verified during the screening and scoping stage in order to reflect the highest priority issues, the following issues are considered likely to be relevant:

a. Changes to flow rates and patterns, velocities, water depth and water quality of the Arun River and tributaries and to groundwater characteristics in the region;

b. Loss of river connectivity and impacts to migratory fish and other aquatic biodiversity;

c. Environmental flow analyses, to determine the required minimum flow to be released from each dam at all times in order sustain the valued river functions identified in the baseline assessment. Relevant valued river functions to consider span both ecological (including downstream aquatic biodiversity and habitats, fish migration pathways, etc.) as well as socioeconomic (to sustain fisheries, irrigation needs, domestic use, or other river-dependent livelihood activities), recreational, religious and cultural functions. The flexibility in varied seasonal environmental flows should also be considered. Any potential effects of the environmental flow requirements on power generation should also be explicitly identified and flagged to the design consultant team;

d. Forest loss in terms of area, type of forest and species with details of the loss of listed species . The forest loss shall be calculated for each project component and facilities;

e. Impact due to spoil disposal;

f. Landslide and soil erosion impacts and slope stability;
g. Quantification of the degree of degradation or loss of natural habitat and critical natural habitat (both aquatic and terrestrial) from direct construction and operation as well as induced from increased use or demand on forests and associated wildlife (timber and non-timber). This should include, in particular, a discussion of impacts to Makalu Barun National Park and Buffer Zone, and any other designated conservation area. Assessment of any loss of terrestrial biological connectivity.

h. Impacts from blasting activities on both natural and human receptors;

i. Impacts related to upstream and downstream changes to sediment movement, sediment deposition, and erosion;

j. Downstream impacts related to peaking pond flushing;

k. Impacts of water impoundment on river bed levels and reservoir bank stability;

l. Impacts of permanent and temporary land acquisition on land use patterns, topography, geology, and slope stability;

m. Impacts of underground excavation and construction works on ground water recharge dynamics, and subsequent effects on any existing spring water sources for local communities;

n. Changes in drainage patterns and resulting effects due to construction of project components and access roads;

o. Impacts to public health via potential water logging and degradation of land and water quality;

p. Impacts related to disposal of used lubricants and toxic chemicals, solid and liquid waste from camps;

q. Potential deterioration in air quality and increased noise pollution due to construction and operation activities;

r. Dam safety risks and issues, including analysis of the impacts to human life and livelihood, natural and built environment in the event of dam failure;

s. Impacts on traffic safety due to increased flow of heavy vehicles carrying construction material, workers etc.;

t. Gender-specific impacts on household activities, employment at project site, illegal trafficking etc.;

u. Induced impacts from Project-related influx – including increased stress on natural resources (especially forests), pollution and waste management issues, strain on local services and infrastructure, safety issues for the local community etc.;

v. Summary of all other social impacts covered under task -3.

34. **Cumulative Impact Assessment (CIA).** In conjunction with the ESIA(s) for the two hydropower components of the Project, the Consultant shall undertake a Cumulative Impact

---

7 The Consultant is advised to refer to the following guidance documents in developing the CIA:

Assessment for the overall Project, focusing on identified Valued Environmental (and Social) Components (VECs) which may be affected by the Project and other development activities planned or underway throughout the Arun River watershed, including but not limited to the Arun III and Lower Arun Projects (see discussion on ‘stressors’ below, as well as Annex 9), and recommending project-level as well as strategic planning level recommendations for minimizing negative impacts and maximizing positive impacts associated with hydropower development at a basin scale. The specific subtasks shall include:

a. *River basin planning and management framework.* Compile information on the legal and institutional framework of water resources management in Nepal as well as information on the main actors and current activities related to river basin management for the Arun Basin with a particular focus on other planned hydropower or irrigation investments both upstream and downstream.

b. *Identification of stressors.* Conduct a desk study to identify and describe all existing or reasonably foreseeable investments, facilities or activities (“stressors”) which have impacts on the flow regime (including connectivity, if migratory fish species which depend on such connectivity are present), water demand, or water quality in the Arun River and its tributaries throughout the watershed (including any significant upstream uses and planned or ongoing investments in China). This will include a preliminary estimation, based on previous studies and aerial information, of natural and regulated flows as a result of existing or planned hydropower plants and abstraction for other purposes. It will also include a preliminary identification of possible sources of sediment or contaminants that may potentially alter water quality within the projects’ direct areas of influence.

c. *Preliminary identification of VECs.* Based on thematic data and previous studies, identify the potential receptors which could be significantly adversely (or also positively) impacted by the identified stressors – i.e., the Valued Environmental (and social) Components. The prioritized VECs should consist mostly of receptors most vulnerable to hydrological or water quality changes that affect the flow regime, aquatic and riverine ecosystems and economic activities and livelihoods depending on water from the Arun River (e.g. fisheries, irrigated agriculture). The nature of the impacts will be described and their scale assessed in a qualitative manner. The VECs will also be finalized through consultation with the locals.

d. *Site visits and consultations to prioritize VECs.* Guided by the results of the desk study, visit the major existing and planned hydropower plant sites and other essential interventions in the basin that may affect water flow and quality. Investigate impacts such as flow regulations, increased erosion or possible contaminant sources, and characterize impacts in terms of their effects on the VECs. During site visits, carry out consultations with local communities, government actors, developers, and other relevant stakeholders including NGOs, irrigation associations, academics, etc. Conduct standard water quality measurements (pH, conductivity, DO, susp. sediments) along the river during site visits and existing river flow gauging and water quality monitoring stations should be visited and evaluated. Based on the findings of the site visits, update and qualify the desk study results and conclusions.

e. **Assessment of cumulative impacts on VECs.** In light of prioritized VECs, identify and assess potential aggregate environmental and social impacts and risks from the combined stressors in terms of the potential change in condition of the VEC (i.e., viability, sustainability). Additionally, identify any potential additive, countervailing, masking, and/or synergistic effects to describe if and how Project associated impacts and risks interact with one another.

f. **Determining significance of predicted cumulative impacts.** Define appropriate indicators and thresholds for acceptable VEC conditions. Describe impact and risk magnitude and significance in the context of past, present, and future actions to determine whether the above assessed impacts affect the sustainability and/or viability of the particular resource or VEC. Identify consequences and tradeoffs of implementing vs. not implementing the Project.

g. **Identification of potential mitigation measures.** Propose mitigation and management strategies to address significant cumulative impacts on VECs. Suggest informed adaptive management strategies to manage uncertainties. Identify and engage together with NEA, wherever appropriate, other parties needed for effective mitigation and management plans, in order to explore opportunities for collaboration on managing cumulative effects and to propose workable coordination mechanisms. Propose monitoring programs to determine effectiveness of proposed management measures.

35. **Environmental and Social Management Plan(s) (ESMPs).** Develop an ESMP, or two separate ESMPs for the UAHP and IKHP components as appropriate, encompassing the following, among other elements as determined to be necessary to meet the objectives of the consultancy, based on the findings of the assessment process:

a. Details on all recommended measures to be taken during construction and operation of the Project to eliminate, minimize, mitigate, compensate and/or offset the identified adverse environmental and social impacts, as well as the recommended specific actions, indicators for monitoring and evaluation, institutional responsibilities, reporting arrangements, and budget needed to implement these measures.

b. Specific sub-plans to manage identified issues, including but not limited to the following elements (some of which may be combined, where determined to be appropriate), to incorporate site-specific and phase-specific mitigation measures that are identified through impact assessment process, as well as generic Environmental, Health and safety Codes of Practice based on international good practices for construction management and project operation which can be annexed to construction, operation and maintenance contracts, where appropriate:

i. Land clearing, wildlife relocation and peaking pond first-filling management

ii. Ecological/environmental flow specification and management

iii. Aquatic ecology management, including fish and fisheries restoration measures (potentially to include a fish ladder, fish hatchery, protection and/or restoration of spawning areas, etc.)

iv. Measures to minimize and mitigate natural habitat degradation and loss, and development and implementation of conservation offsets where required to meet the objectives of World Bank OP 4.04

v. Reforestation / afforestation programs (including management of tree nurseries and plantations, if applicable, taking into consideration the requirements of World Bank OP 4.36 on Forests and OP 4.09 on Pest Management, as well as
requirements of Ministry of Forests and local forest governance entities as per national regulations)

vi. Terrestrial ecology management

vii. Erosion prevention and sediment management program, including upper watershed management and restoration activities as well as sediment flushing management measures

viii. Construction camps management

ix. Quarry and course aggregates management

x. Construction waste and trash disposal

xi. Pollution abatement

xii. Muck/spoil management plan with spoil destination

xiii. Topsoil saving management

xiv. Watershed management

xv. Buffer zone management

xvi. Cultural heritage management

xvii. Hazardous materials and explosives management

xviii. Occupational health and safety management (with specific section on subsurface activities including tunneling)

xix. Environmental, health and safety training

xx. Emergency preparedness and response

xxi. Dam safety plan (to be developed in detail by the Engineering Design Consultant; the ESMP should focus on summarizing the key elements of relevance to local communities and stakeholders)

xxii. Traffic safety plans to minimize hazards to highway vehicular flow and to local inhabitants

xxiii. Mitigation measures for long-term and cumulative social and environmental impacts

c. A Monitoring Plan that details the key parameters to be monitored, monitoring locations and frequencies, monitoring methodologies, required budgets, and responsible entities to carry out monitoring for each of the above-mentioned sub-plans as well as to follow up on monitoring outcomes, including to identify root causes and correct non-compliances (including through remedial measures if required), as well as to enable continuous evaluation of overall performance and adjustments to management measures and arrangements as needed to enhance overall project sustainability. Independent auditing
arrangements, as well as incentive schemes and/or penalties to enhance compliance, should also be proposed.

d. Detailed organogram showing all actors to be involved in ESMP implementation, monitoring, reporting, independent supervision and auditing, their relationship to overall project construction and operational management teams and contractors, and points of interface with independent oversight entities. Organogram should indicate entry points for local citizen engagement and NGO participation in monitoring and reporting.

e. Outline of minimum qualifications required for each institution or actor involved in ESMP implementation to carry out their responsibilities, including with respect to project management, implementation of mitigation and management measures, execution of monitoring programs, reporting and evaluation, public engagement and grievance redress, etc. The training and capacity building needs to ensure satisfactory implementation of the ESMP and proposed measures for each actor involved in implementation should also be specified, based on an assessment of the organizational capacity of each to fulfill their proposed functions. The core content of training programs for contractors and other key actors involved in implementing the ESMP should be outlined, as well as the responsibilities, timelines, and budget for their implementation.

36. **Assembly of draft ESIA(s), CIA, and Executive Summary, including local-language summary materials for public consultation.** The Consultant shall produce full draft ESIA(s) and CIA (in English), as well as a single Executive Summary covering both hydroelectric components (in both English and local language) and additional materials for use in consultations (e.g., slide deck, brochures and other visuals, factsheets, etc.), incorporating all of the above-mentioned elements, as well as other elements outlined in Annex 10 and/or identified as necessary during the screening and scoping phase of the consultancy.

37. **Disclosure and Consultations on draft studies.** The Consultant shall support NEA in carrying out and fully documenting at least one additional round of consultations (to include, at minimum, two workshops at district and central levels and one public hearing), once the draft environmental assessment and planning materials are available. The consultations should consist of public hearing(s) as and where required under national legislation (at Village Development Committee or Municipality of project site, as per GoN Environmental Protection Regulation 2054), as well as additional public meetings, focus groups, interviews and/or other consultation techniques as deemed appropriate to ensure that all project affected groups and other stakeholders have the opportunity to learn about the project and its impacts and to have their views taken into account in finalizing the study. Consultations should follow international good practices on stakeholder engagement, with detailed records kept including locations and dates of all consultation events, participants’ names and affiliations, a summary of topics discussed; a summary of comments received and ensuing discussion; and how those comments will be taken into account by the project. Prior to carrying out consultations, the draft versions of the studies must be made available at a public place, accessible to project-affected groups and local NGOs.

38. **Finalization of studies.** Following consultations as well as review of the draft studies by NEA, the Panel of Experts, and the World Bank, the Consultant shall make necessary revisions and finalize the studies. The Consultant shall submit the revised ESIA report to NEA for the approval of Ministry of Environment. The Consultant will make a presentation on the findings of ESIA report(s) to Ministry of Environment and submit
revised documents to NEA incorporating the comments of ministry. NEA will forward the revised documents to Ministry of Environment for their approval.

39. **Key expected outputs of Task 2:** (a) Full ESIA for the Project, incorporating all the elements outlined above and in Annex 10, including the CIA (or two separate ESIs for the two hydroelectric components if required under national legislation, each summarizing and annexing the integrated CIA), revised to incorporate feedback received during consultations as well as from NEA, the World Bank and the Independent Panel of Experts, and including documentation of all consultations held; and (b) single Executive Summary covering both hydroelectric components, in both English and Nepali.

**Task 3: Social Planning**

40. This task covers the social aspects of the project planning and design. The social aspects relate to land acquisition, involuntary resettlement, indigenous people, downstream impacts, gender, public health, conflicts, public consultation, participation and communication. As noted earlier under Task 2, this task is expected to be carried out in a coordinated manner with the environmental assessment and planning aspects of the consultancy, to ensure holistic and integrated analysis. The outputs described below should also be integrated in summary format into the ESIA(s) and overall Executive Summary. The assignment will comply with relevant laws and policies of the Government of Nepal (GoN), international conventions ratified by the GoN, and the relevant safeguard policies of the World Bank. The Consultant will carry out necessary activities required for completion of the assignment including in-house reviews, field surveys and planning activities, stakeholder consultations and development of the necessary interventions. The field planning activities will employ sample surveys and suitable sociological/anthropological tools, including focus group discussions and key informant interviews. Given the spread of Project works and extent of planning activities, the planning approach and methodology will vary in its design for different planning tasks. These should be proposed and described in detail in the Inception Report.

41. **Social assessment.** A social assessment shall be conducted for the proposed Project. This assessment will cover the following key areas: (a) overall project impact analysis (as described under Task 2 above), (b) development of a socioeconomic baseline, (c) a stakeholder analysis, (e) identification and consultation with vulnerable and indigenous communities. Based on these analyses, the social assessment will provide specific recommendations for different planning tasks under this consultancy. Items (b) through (e) are described in more detail below.

42. **Socioeconomic baseline.** The Consultant will conduct a socioeconomic survey and develop a socioeconomic profile of the Project area, bringing out its key social, ethnic, cultural, political and economic characteristics. This survey will cover at least the aspects delineated below. The socioeconomic profile will include a differentiated analysis related to gender, disadvantaged groups, and “deep poverty” dimensions of these and all other included aspects.
   a. Developing a demographic and ethnic profile of the population in the Project Area of Influence and zooming in specifically on the people and communities in the Social Impact Zones, covering their history, physical spread, social clustering, cultural and traditional characteristics, interactions and relations among various groups.
   b. Mapping out the socioeconomic development status of the Project area, including resources conditions, economic development status, employment sources and patterns, livelihood patterns, infrastructure and service provision (health, education,
employment, extension services etc.), as well as local development needs, priorities and challenges, and development interventions.

c. Developing a socioeconomic baseline for the affected communities and population, covering basic indicators particularly related to their living standard and well-being.

d. Land tenure system (titles vs customary), mode of land transactions, access to natural resources and their significance to local communities and livelihoods, formal and informal institutions and their capacity and functioning; development needs, challenges and status.

e. Identification of presence of vulnerable and indigenous peoples’ communities residing in the Project area; and if they are identified, collection of information on their demographics, social cultural features, livelihood and employment patterns, use of natural resources, formal and informal institutions and interactions with other ethnic groups (See also section on indigenous peoples below).

43. Stakeholder analysis. This analysis is important to inform the design of the Project, particularly in developing the Project consultation and communication strategy. This task is a continuation of the stakeholder analysis started under Task 1. The stakeholder analysis will incorporate dimensions related to gender, disadvantaged groups, and “deep poverty.” The following are key activities to be covered under this task:

a. Mapping of key stakeholders at national and local levels, including Project affected people, affected communities, local government bodies, NEA, NGOs/CBOs, media and key individuals, etc.

b. Carrying out consultations with various stakeholders to bring out their views, concerns and expectations associated with the Project;

c. Analysis of stakeholder consultation feedback, their roles and possible interventions in Project preparation and design;

d. Proposing recommendations for consideration in the Project’s design.

44. Resettlement Action Plan (RAP). The proposed Project is expected to require land acquisition and involuntary resettlement for all civil works components. Although the direct works at the two dam and powerhouse sites are not expected to cause large-scale displacement, given their remote locations and low population density, the access roads and other ancillaries will likely require more significant land acquisition. Resettlement planning will identify all impacts of land acquisition and resettlement, review relevant legal and policy requirements of the GoN and the World Bank, and develop a Project entitlement policy and mitigation measures to address these impacts in a locally appropriate manner. Leading to the preparation of the RAP, the activity will generate a database of physical and livelihood impacts and affected individuals and households. A recommended RAP outline is attached (see Annex 11). Planning activities include, but not limited to, the following,

a. Inventory survey of physical impacts. This survey will cover the Project’s Impact Zones (e.g., zones in which use of or access to land, assets, and/or sources of livelihood or subsistence (including natural resources) are to be restricted as a result of land acquisition for the Project) will be conducted according to legal procedures under relevant Nepali laws. This survey will lock in the physical quantity of impacts and lay down the basis for developing the entitlement policy and compensation package. It should be kept in mind that not all impacts can necessarily be quantified and enumerated upfront on a household basis. More suitable methods of assessment and documentation will be evaluated and employed such situations.
b. **Census survey of affected populations.** The survey will cover all affected populations, recorded by households or communal groups, and record types of potential impacts. It will establish the cut-off date for eligibility for resettlement entitlement.

c. **Review of relevant legal policies.** This review will cover relevant policies of GoN and the World Bank, identify any gaps, and propose measures to fill in these gaps under this Project.

d. **Development of a Project resettlement policy.** On the basis of the above review, a Project resettlement policy will be produced, including a resettlement entitlement matrix for the project. This will form the policy basis and chapter of the RAP, and will also be elaborated into a free-standing project Resettlement Policy Framework (RPF) for any future unanticipated resettlement impacts.

e. **Development of resettlement strategy and measures.** The proposed project is expected to have limited impacts in terms of physical relocation. Nonetheless, a relocation strategy and action plan should be developed, including identification and development of relocation sites, to be planned in consultation with the communities and relocating households.

f. **Development of livelihood restoration and development strategy and measures.** An in-depth impact analysis should be conducted for effects on livelihood patterns in the Project’s Impact Zones. Such an analysis will assess the needs for livelihood restoration and provide the basis for designing appropriate interventions. In designing the livelihood development strategy and plan, the Consultant should consider support for long-term sustainable development of affected areas as well as support for development of the project areas beyond the adversely affected households and communities.

g. Development of implementation arrangements.

h. Development of grievance redress and monitoring mechanisms. The grievance redress mechanism should be a project mechanism, open to all issues related to the project, including resettlement issues. The mechanism should build in elements of neutrality to ensure fair, transparent and independent deliberations.

45. **Vulnerable and Indigenous Peoples Development Plan.** About a third of the Nepali population belongs to indigenous communities classified and officially recognized by the GoN. Indigenous peoples feature prominently on Nepal’s development agenda. The Project area is inhabited by several indigenous communities who are expected to be impacted both positively and adversely by the Project. This plan will aim to minimize negative impacts and enhance positive impacts to vulnerable and indigenous peoples in the Project area. A recommended outline for the Vulnerable and Indigenous Peoples Development Plan is attached (see Annex 12). Planning activities in this regard include, but are not limited to, the following (part of the information below will be documented in the ESIA studies outlined under Part 2 of this consultancy):

a. Identification of vulnerable and indigenous communities in the Project area;
b. Gathering of baseline information on the demographic, social, cultural and political characteristics of the vulnerable and indigenous peoples’ communities in the Project area;
c. Review of the land tenure system; use of, access, and attachment (physical, spiritual and cultural) to natural resources by different indigenous communities, including their customary rights and occupation, both individual and collective;
d. Review of Nepal’s legal and institutional framework regarding vulnerable and indigenous communities, including relevant laws and policies of GoN, any ratified international conventions (ILO 169 and UNDRIP), and the World Bank policy on indigenous peoples (OP 4.10);
e. Identification and mapping of indigenous organizations, including public institutions and civil society organizations;
f. Assessment of Project impacts, both positive and adverse, on vulnerable and indigenous communities, particularly impacts specific to ethnic characteristics (e.g. impacts on livelihood activities if unique from the general use of resources, both individual and common; impacts on use of cultural resources such as sacred religious or cultural historical sites); as well as security risks and impacts related to in and out migration of people in connection with the project. Critical to this assessment is an analysis of the relative vulnerability of, and risks to, the affected indigenous peoples’ communities given their distinct circumstances and close ties to land and natural resources, as well as their lack of access to opportunities relative to other social groups in the communities, regions, or national societies in which they live;

g. Consultations with indigenous communities, following a free, prior, and informed consultation process at each stage of the Project, particularly during Project preparation, to fully identify their views, concerns, requests and recommendations for the Project and confirm their consent to the implementation of the Project;

h. Providing Project information in a fashion, method and language that are appropriate to the indigenous communities;

i. Development of a policy framework on vulnerable and indigenous communities for the proposed Project;

j. Development of a process framework in the case that Project environmental mitigation measures result in restrictive impacts on access to natural resources resulting in livelihood impacts of the associated population;

k. Proposing, based on free, prior, and informed consultation with the affected indigenous peoples’ communities, necessary measures to avoid, minimize, mitigate, or compensate for such effects, and to ensure that the indigenous peoples receive culturally appropriate benefits under the Project.

A vulnerable and indigenous peoples plan shall be developed incorporating the above.

46. Downstream impacts management plan. The Project will have impacts on downstream social, economic and cultural activities with the damming of the river and altered water flow patterns. Impacted activities could include fishery activities and possible other uses of the river, such as domestic water use and irrigation as well as local/national tourism activities. The Consultant will carry out the following activities to plan for mitigating downstream impacts and enhancing benefits for downstream communities, in a closely coordinated/ integrated fashion with the environmental assessment and planning process described under Task 2 above:

   a. Identification and assessment of possible impacts downstream of the proposed dams;
   b. Identification and inventory of communities that are likely to be affected;
   c. A detailed analysis of the type and levels of impacts upon different populations;
   d. Development of a socioeconomic profile of the potentially affected communities;
   e. Development of necessary mitigation strategy and intervention measures based on the above impact analysis.

47. Gender assessment and action plan. Women are important stakeholders in hydropower development, falling among both the affected and the beneficiaries. It is important to understand the gender dimensions of the project and the differential impacts on women so as to maximize project benefits. The gender assessment and action plan will cover, but not be limited to, the following:

   a. Review of the legal and policy framework in Nepal relevant to gender;
b. Review of formal and informal institutional structures and processes that affect gender outcomes in the project and under the project setup;

c. Review of setup, capacity and constraints within relevant institutions to address gender concerns and considerations;

d. Analysis of local culture, particularly among different indigenous groups, regarding gender and women, focusing particularly on the informal institutions, cultural norms, behavior, and customs;

e. Review of traditional roles and current status of women in the social, economic, cultural, political and institutional contexts of the communities in the project areas;

f. Analysis of potential project impacts, both positive and negative, on women;

g. Analysis of barriers, challenges, constraints to women’s participation, including an assessment of women’s capacity to participate;

h. Identification of potential entry points and interventions to enhance gender sensitivity, mitigate adverse impacts, promote women participation, maximize project benefits for women;

i. Advice to the project planning and implementation teams on approaching and addressing gender issues under the project;

j. Recommendations for approach and interventions to promote project benefits to women and their participation in the project.

48. Benefit-sharing action plan. Benefit-sharing is an increasingly used mechanism in hydropower investment operations to build local support and promote local area development. This mechanism has been used in Nepal as well as elsewhere around the world. The Ministry of Energy of Nepal has completed a review on benefit-sharing. The Consultant will work with NEA and the Engineering Design Consultant and to carry out the following in this regard:

a. Review and summary of Nepali laws, policies, and international conventions endorsed by the GoN relevant to benefit-sharing, particularly those on use of natural resources and indigenous communities;

b. Review of benefit-sharing experiences in hydropower sector in Nepal;

c. Carrying consultations with local stakeholders, in particular with local indigenous communities, over their expectations from this project;

d. Review of benefit-sharing proposal from project feasibility studies for UAHP and IKHP;

e. Define “benefit-sharing,” design, and propose a benefit-sharing scheme for the project;

f. Include differential benefit analysis for those whose livelihoods and land values will be disproportionately enhanced by road provisioning/improvements.

49. Public health assessment and action plan. The construction of the full project will have adverse public health impacts due to dust, noise, pollution, and migration of construction workers into the project. The transportation of heavy machine and equipment to the project area by road may cause additional hazards, accidents and human injuries. It is therefore necessary to generate awareness of potential impacts, and initiate both preventive and mitigation measures to minimize risks and possible harmful effects on public health. Planning activities will include, but not be limited to, the following:

a. Undertaking an assessment of potential public health impacts of the proposed project during pre-construction, construction, and post-construction stages; and evaluating the need for appropriate interventions;

b. Undertaking an assessment of the existing public health service conditions in the project areas including infrastructure and facilities, services provided by public health care
systems, provision of health care information and education, and disease prevention and promotion campaigns, specifically related to sexually transmitted infections and HIV;
c. Engaging with local communities, including existing health specialists (both modern physicians and traditional medicine men or healers), to understand existing health beliefs, practices, and health care systems;
d. Determining public health needs and level of support required by resettlers, construction workers, migrant workforce, and host communities within the context, conditions, and parameters prevailing in the project area;
e. Designing a project public health action plan to mitigate adverse impacts, reduce occupational hazards and health risks, and support the health and well-being of local communities.

50. **Public participation and consultation plan (including Inter Agency Coordination).**
Drawing from the stakeholder consultation strategy developed during the screening and scoping phase, develop a full plan covering the following objectives: (a) to outline the specific activities, logistics and schedule for the consultation and inter-agency coordination processes to take place throughout the environmental and social assessment and planning stage, ensuring that consultations are coordinated and executed together with different entities and at different levels (government, municipality, NGOs, local communities etc.) in order to capture a range of participants, and also to ensure the stakeholder consultation is continuous throughout the project; (b) to identify possible avenues of public interaction, in addition to interviews and public meetings, especially through proactive use of social media and newer communication technology; (c) to identify points of entry for ensuring local people as more active participants (rather than simply respondents) in consultations, and (d) to map out a strategy and required actions, including implementation arrangements, responsibilities and budget, for ongoing engagement, consultations, and grievance / dispute resolution activities throughout the life of the Project.

51. **Communications strategy and action plan.** Given the remote location of the project, the high profile of hydropower development, and the history of hydropower development in the Arun Valley in particular, it is important to develop a communication strategy for continuous communication between the project implementation authorities and all other stakeholders throughout the life of the projects. The objectives are to (i) help strengthen public understanding and support for the projects and create an enabling environment for their implementation; (ii) enable public communication and continuous flow of information on project activities, impacts, and benefits; (iii) manage relationships with key external stakeholder constituencies; and (iv) facilitate dispute resolution and public monitoring of project implementation. The communication strategy must suit existing social, economic, and cultural conditions, as well as the complex and sensitive issues related to large hydropower projects. This assignment will include detailed review of secondary information, but will primarily depend upon field visits and direct consultations/interactions with stakeholders at the local and national levels.

52. The following tasks will be carried out:
   a. A desk review of past history and experiences in hydropower development in Nepal and the Arun Valley, particularly its social, environment and political aspects.
   b. Identification of key stakeholders (individuals, groups, and institutions) and detail their interests, concerns and expectations, roles and relationships vis-a-vis the proposed program, with particular focus on the benefits of hydropower projects and management of adverse impacts;
c. Assessment of communication needs to map stakeholder perception and attitudes to the project, including modes and media of communications to be adopted during project implementation;
d. Assessment of existing communication and engagement initiatives, and capacities of the NEA to conduct public communications and to engage stakeholders; identify gaps in NEA’s institutional set-up (in terms of staffing, procedures, budgets etc.);
e. A media-mapping at the national and local levels, including a detailed mapping exercise of key relevant NGOs, civil society organizations and individuals;
f. Identification of opportunities and platforms for effective dissemination of key messages over the course of project implementation;
g. Preparation of a draft communication and engagement strategy for the overall project, taking into consideration current practices and experience of NEA and GoN.

53. **Institutional capacity assessment and strengthening.** The consultant will carry out an assessment of the current institutional capacity in place in view of implementing the environmental and social interventions, management measures and programs related to the Project. This assessment should cover all key institutions involved, including the Ministry of Energy, NEA and local administrations. The consultant will propose a set of interventions, including institutions, staffing, and budget requirements, to build up the capacity of these institutions to implement the designed programs.

54. **Key expected outputs of Task 3:** (a) Social Assessment Report; (b) Resettlement Action Plan; (c) Resettlement Policy Framework; (d) Vulnerable and Indigenous Peoples’ Development Plan; (e) Public Health Action Plan; (f) Gender Action Plan, (g) Downstream Impacts Management Plan, (h) Benefit Sharing Plan; (i) Public Participation and Consultation Plan (including Inter Agency Coordination); (j) Communication Strategy and Action Plan and (h) institutional assessment and strengthening plan.

**Deliverables and Reporting Schedule**

55. The following anticipated deliverables are expected at the time indicated below. The timeline indicated is an estimate only, and may be adjusted upon negotiation of the contract, and updated again as needed at the time of work plan development. The screening and scoping phase of the consultancy will confirm the full list of deliverables required, and could result in a reorganization of some of the items below, and/or may result in identification of additional specific assessments or plans not listed below which are needed in order to meet World Bank or national requirements. The content for each proposed study will be agreed with NEA during the process of finalizing the Inception Report, and the timeline for their delivery would be agreed between the Consultant and NEA at the time of work plan development.

consultations, and EIA Terms of Reference with detailed work plan for carrying out environmental and social assessment and planning studies

4. Drafts of all deliverables under Tasks 2 and 3, including:
   - EA Executive Summary, in both English and local languages
   - ESIA(s), including ESMP(s), covering both UAHP and IKHP, incorporating Alternatives Analysis
   - Cumulative Impact Assessment
   - Social assessment report
   - Resettlement action plan(s) for the project
   - Gender assessment and action plan
   - Vulnerable and indigenous community development plan(s)
   - Public health action plan
   - Downstream impact mitigation plan
   - Resettlement policy framework
   - Benefit-sharing action plan
   - Public participation and consultation plan
   - Communication strategy and action plan

   October 2015

Final versions of Task 2 and 3 deliverables as outlined above, reflecting feedback provided by NEA, World Bank, International Panel of Experts, and stakeholders during public consultations

December 2015

Final ESIA report(s) incorporating comments of Ministry of Environment

January 2015

**Consultant Staffing and Key Qualifications**

56. The Consultant must be a corporate firm or a consortium of firms that satisfies the following criteria:

a. Possession of adequate and proven experience in ESIA, CIA, and social planning, including in particular indigenous peoples, involuntary resettlement and livelihood restoration planning;

b. Possession of adequate, qualified and experienced key personnel and logistic resources to carry out the assignment;

c. Possession of appropriate office facilities and support staff;

d. Knowledge of Nepal, and an appropriate language skill mix within the team to carry out field work, interact with project stakeholders, and produce written materials in both English and Nepali;

e. Knowledge of, and previous experience carrying out environmental and social studies in accordance with, World Bank safeguard policies.

57. The Consultant shall propose and justify the range of disciplines to be included in the core project team and the complementary skills of the short-term specialists. The inputs by all
specialists should be clearly indicated as it is anticipated that a substantial part of the work program is carried out by the firms or individuals subcontracted locally. It is expected that the core project team will include, but not necessarily confined to, the following key specialists:

a. **Team leader**, an environmental impact assessment specialist with 10 years of experience including experience in hydropower projects. Knowledge and experience with World Bank safeguard policies will be required. Experience with Nepal legal requirements, and experience with other multinational requirements, also desired. Demonstrated ability to integrate social and environmental elements with infrastructural details of the Project.

b. **Indigenous peoples’ specialist**, who has knowledge about World Bank and GoN policies on indigenous people and who has demonstrated experiences working on indigenous peoples issues in Nepal and applying World Bank indigenous people’s policy.

c. **Resettlement specialist**, who has knowledge of World Bank and GoN resettlement policies and who has carried out resettlement and livelihood development planning in hydropower projects.

d. **Gender specialist**, who has knowledge of World Bank and GoN policies on gender and who has demonstrated working experiences carrying out similar assignments in internationally-financed operations.

e. **Senior aquatic ecologist**, with 10+ years of international experience in aquatic ecology impact assessment and management in Himalayan contexts. Should have knowledge of Himalayan fish species, fieldwork experience, and experience developing and/or implementing fisheries and aquatic biodiversity mitigation programs related to hydropower projects (for example, fish hatcheries, fish ladders, etc.). Demonstrated ability to work as part of a multi-disciplinary team. Would be supported as needed by suitable national experts.

f. **Senior terrestrial ecologist**, with 10+ years of international experience in terrestrial ecology impact assessment and management issues related to infrastructure projects, including in the hydropower sector. Should have knowledge of the ecological dynamics of Himalayan and hilly ecosystems in Eastern Nepal, fieldwork experience, and experience developing and/or implementing programs on natural habitats conservation, compensatory offset, and watershed management. Demonstrated ability to work as part of a multi-disciplinary team. Would be supported as needed by suitable national experts in sub-disciplines such as ornithology, herpetology, butterfly expert / entomology, etc. as required for the studies.

f. **Hydrogeological engineer**, with suitable experience conducting technical field surveys on soil sediments, water quality etc., and with experience in sediment management and erosion control programs for hydropower operations.

g. **Communications and stakeholder engagement specialist** with knowledge of Nepal and prior experience managing engagement and communications programs with local communities and stakeholders on internationally-financed projects. Specific knowledge and prior experience in the hydropower sector, and with World Bank financed projects, is strongly desirable.

h. **Additional technical specialists** with appropriate qualifications and experience at the national level (supplemented by additional international experience as required) in hydrology, geology, environmental engineering, forestry and watershed management, climate change, archaeology, anthropology or other social sciences, and public health, among others as required to complete the tasks described in these Terms of Reference.

**58.** The Consultant shall name individuals to participate in specified roles within the project team and provide full curricula vitae (in accordance with the suggested format shown in the Letter.
of Invitation) and any other information considered relevant by the Consultant. The Consultant shall name the project leader, the deputy team leader, the other core team members and key short-term specialists, and provide an assurance that all members of the proposed team will be made available as specified in the proposal, if the Consultant is named.

**Support to be Provided by NEA and World Bank**

59. NEA will provide all necessary assistance to help the Consultant obtain access to information and key individuals as required to complete the assignment. Various available supporting documents will be provided to the Consultant before the initiation of the assessment (see Annex 8). NEA will also provide support to field work logistics where deemed necessary, participate in public consultation events, provide technical feedback on draft deliverables, and facilitate coordination and information sharing with the Engineering Design Consultant and the Independent Panel of Experts.

60. The World Bank will support NEA in providing technical oversight to the Consultant, including reviewing and providing feedback on draft deliverables.

**Training/Capacity Building**

61. One of the basic objectives of the consulting services is transfer of technology in the field of ESIA and CIA study to the NEA’s engineers, and environmental and social personnel. This will be achieved by involving NEA’s engineers, and environmental and social personnel in various activities of the project implementation during the execution of ESIA & CIA study, as well as through targeted training events and activities.

a. During the inception phase of the contract, the Consultant shall perform a skills assessment and develop a training program for NEA counterpart staff. All international experts are expected to work closely with the NEA counterpart and shall ensure that the NEA counterpart will achieve higher skill levels as a result of their involvement in the project.

b. The training program shall also include, among other aspects to be suggested by the consultant, a series of workshops, and observation visits, covering the following disciplines. The program should have duration of approximately 20 days in total and shall be held.

- Environmental and Social Screening and Scoping
- Environmental and Social Alternatives Analysis
- Environmental and Social Impact Assessment
- Cumulative Impact Assessment
- Environmental and Social Management Plans
- Downstream Impact Management, including environmental flows
- Social Planning
- Resettlement Action Plan

**Payment Schedule**

62. For the performance of the duties enumerated under the Terms of Reference, the Consultant will be paid a lump sum fee. The proposed payment schedule of the lump sum fee is as follows. Bidders may also propose an alternative payment schedule with justification, for NEA’s consideration.

- Draft Scoping Report and ToR (Task 1 draft deliverable) – 20% of contract value
- Final Scoping Report and ToR and Workplan (Task 1 final deliverables) – 10% of contract value

- Draft environmental and social assessment and planning studies (Tasks 2 and 3 draft deliverables) – 30% of contract value

- Final environmental and social assessment and planning studies (Tasks 2 and 3 final deliverables, incorporating also Phase I final deliverable) – 30% of contract value

- Completion of training/capacity building program for NEA engineers and staff – 10% of contract value

**Budget**

63. The initial estimated budget for this consulting service is approximately US$2.6 million (including all estimated taxes).

Annex 6. Ikuwa Khola Hydropower Project Location

- Feasibility Study Conducted by DOED

- Location
  - 5 km Upstream of Arun-3 Headworks
  - 8 km Downstream of Upper Arun P/H Site

- Power and Energy
  - Installed Capacity 18 MW
  - Annual Energy of 120 GWh

- Will be developed as a component of UA HEP.
  - Share to local people in lieu of Upper Arun will be compensated by this project.
Annex 7. UAHEP Access Road Details
64. The following documents will be provided to the Consultant before the initiation of the assessment. The Consultant may only use these documents for the purposes of this Project. The list should be considered preliminary and may be updated prior to initiation of the contract.

1) Project Brief Notes on Upper Arun Hydroelectric Project, *Project Development Department, Engineering Services, Nepal Electricity Authority, 2013.* This briefing prepared by NEA provides a quick snapshot of the Upper Arun Hydropower Project, along with the latest details on project planning.

2) Feasibility Study Review Report, Upper Arun Hydroelectric Project, *Nepal Electricity Authority, 2011.* This study reviews the feasibility study commissioned by the NEA and completed in 1991 by the Joint Venture of Morrison Knudsen Corporation, Lahmeyer International, Tokyo Electric Power Services Co, and NEPCON. In particular, it identifies changes in the current status and project needs for infrastructure such as roads, transmission lines, telecommunication facilities etc. at and around the project site; documents information relevant to technical upgrading of the detailed engineering study of the project; reassesses and updates the energy generation capacity, power evacuation mechanisms, and project costs; and documents initial data for an environmental impact assessment, which was not carried out in the 1991 feasibility study.

3) Upper Arun Hydroelectric Project, Feasibility Study Phase II – Final Report, Volume I, Chapter 11, *Morrison-Knudsen Engineers Inc et. Al., 1991.* This section of the feasibility study is an abbreviated version of the full environmental assessment study report available in the project files deposited with the Nepal Electricity Authority, Kathmandu, Nepal. This impact assessment was based upon the specificity of the engineering and design information available to the environmental team at the time of field study in December 1990. Field baseline data related to soils, water quality, vegetation, wildlife, fisheries, land-use, agriculture and people were collected; while this abbreviated report provides summary descriptions, it indicates that actual collected is available in the full version of the report, available at NEA’s depository. The document seeks to: (i) examine the suitability of the Upper Arun site as a hydroelectric power plant site; (ii) identify the most cost-effective configuration and prepare preliminary engineering and siting plans that are as environmentally sound as possible, and (iii) recommend any further studies that may help in minimizing the project’s negative impacts while enhancing its benefits to region’s natural and social environment. The description of proposed project impacts in this document are generic and high-level in nature, focusing on those judged to be most important in the context of project evaluation, planning, and implementation; Nepal’s environmental priorities; and the significance of local resources. It is therefore an important input into the ESIA to be completed under this consultancy, but is not itself a comprehensive evaluation of potential impacts.

22) Upper Arun Hydroelectric Project, Feasibility Study Phase II, Supplemental EIA of Fisheries, Volume 3, Appendices, Morrison-Knudsen Engineers Incet. Al., 1991. This document considers the impact of the proposed Upper Arun Project on fisheries.

39) GLOF study from ICIMOD, and other information or data from ICIMOD
Annex 9. Other development projects in the watershed

The ongoing, planned, and identified development projects in the Upper Arun watershed which are presently known include the following. Each of these may be potential contributors to cumulative impacts of the UAHP and IKHP projects. The list provided is preliminary, and will need to be verified and potentially expanded pending further research to be carried out by the Consultant, and in further discussions with NEA, in the course of implementation of the study.

a. Arun III Hydropower Project: Arun III is a proposed 900 MW run-of-river hydropower project to be located on the Arun River about 35km south of the UAHP dam site. It is currently proposed to consist of a 68m high concrete gravity dam across the Arun River near Num Bazaar that will create a 4 km long impoundment. Flows will be diverted into an underground desanding basin, and then through a 11.7 km long, 9.5 m diameter tunnel to Pikhuwa, where the underground powerhouse will be located. The project is proposed to include a transmission line with a ROW that is not presently known at the time of development of this TOR. Detailed engineering designs and environmental and social assessment and planning studies were carried out for an earlier 402 MW version of this project in 1994 with support from the World Bank; however, the project was not implemented. The current project is proposed to have over twice the generation capacity of the previously considered version, with a modified design. Today, the project studies are being updated by SJVN Ltd, a JV of the Government of India and the Government of Himachal Pradesh.

b. Lower Arun Hydropower Project: The Lower Arun Hydropower Project is a proposed 400 MW project located downstream from Arun III, with the headworks before the confluence of the Arun River and the Sankhua River. The proposed project components include a 95m×36m×9.5m settling basin; a 15.1km, 8.5m diameter headrace tunnel; a 107m, 27m diameter surge tank; a 6m diameter penstock pipe; an underground powerhouse with 4 Francis Turbines; and, a 100m, 8.5m diameter tailrace channel. A proposed 400kV transmission line would evacuate power from Lower Arun to the interconnection point at Dhalkebar. NEA undertook a preliminary socio-economic impact study for the Lower Arun Hydropower Project in 1990.

c. Sabha Khola “A” Hydropower Project, 8.3 MW
d. Sabha Khola “B” Hydropower Project, 9.86 MW
e. Sabha Khola Hydropower Project, 3.3 MW
f. Upper Piluwa Khola Hydropower Project, 11 MW
g. Lower Piluwa Khola Hydropower Project, 9.5 MW
h. Apsua Khola Hydropower Project, 8.4 MW, GoN reserved
i. Sankhua Khola Hydropower Project, 32 MW, GoN reserved
j. Upper Sankhua Khola Hydropower Project, 35.34 MW, GoN reserved
Annex 10: ESIA key contents as per World Bank requirements

(refer also to World Bank Operational Policy 4.01 (Environmental Assessment), Annex A.)

a. Executive Summary (in English and Nepali)

b. Introduction

c. Detailed Project Description.

d. Legal and Institutional Framework. Include national legislation related to environmental and social management issues applicable to the project, relevant international treaties or commitments, applicable World Bank safeguard policies and EHS Guidelines, and institutional structure and capabilities. Summarize key compliance issues and processes related to each of these requirements, including licensing and permitting status.

e. Baseline, to include covering all relevant physical, biological, socioeconomic and cultural aspects of the full Project Area of Influence.

f. Alternatives Analysis

g. Impact Analysis, covering all direct, indirect, and induced impacts in both the short-term and the long-term, and proposing mitigation measures for each of construction and operations stages of the project. The analysis should follow an internationally recognized methodology to assess the significance of each identified impact, both before and after the application of recommended mitigation measures.

h. Cumulative Impact Assessment (CIA)
i. Environmental and Social Management Plan (ESMP), covering:
   i. Details on all measures to be taken during construction and operation of the project to eliminate, minimize, mitigate, compensate and/or offset adverse environmental and social impacts, as well as the recommended specific actions,
   ii. Specific plans as determined to be necessary to mitigate and manage environmental, social and health and safety impacts and risks identified through the impact assessment process;
   iii. Indicators for monitoring and evaluation,
   iv. Institutional responsibilities,
   v. Reporting arrangements,
   vi. Budget needed to implement all measures,
   vii. Monitoring Plan that details the key parameters to be monitored, monitoring locations and frequencies, monitoring methodologies, required budgets, and responsible entities to carry out monitoring as well as to follow up on monitoring outcomes, including to correct non-compliances as well as to adjust management measures as needed to enhance overall project sustainability,
   viii. Detailed organogram showing all actors involved in ESMP implementation, monitoring, reporting, independent supervision and auditing, their relationship to overall project construction and operational management teams and contractors, and points of interface with independent oversight entities,
   ix. Detailed Environmental Codes of Practice outlining generic management and mitigation measures based on international good practices for construction management, which would be annexed to contractor bidding documents in addition to other project-specific measures and plans identified through impact assessment process.

j. Appendices, to include:

67
• List of ESIA Report preparers
• References (for written materials used in the preparation of the ESIA Report)
• Detailed maps of the Project Area of Influence that consider:
  • Forest cover
  • Forest loss and degradation
  • Land use
  • Ecosystems
  • Protected areas, critical and natural habitat
  • Location and ranges/distribution of fauna and endangered species
  • Peaking pond / weir site
• Records of interagency and consultation meetings, including consultations for obtaining the informed views of the affected people and local nongovernmental organizations (NGOs)
• Tables presenting the relevant data referred to or summarized in the main text
• Terms of Reference of this study
• Terms of Reference of the International Panel of Experts (to be provided to the Consultant)
• Other annexes as applicable

1. Project description, including design alternatives considered
2. Socioeconomic baseline.
3. Project impacts and affected population, including the Project’s Impact Zones and details from the inventory and census surveys.
4. Project resettlement policy framework, including summary of the legal framework in Nepal, ii) a comparison with World Bank OP 4.12 and proposed measures to fill in any gaps, and iii) a project entitlement policy;
5. Compensation rates and their evaluation basis and methodology, and resettlement and rehabilitation packages;
6. Compensation and resettlement approach and action plan.
7. Community consultation and participation, descriptions of consultations carried out during project preparation and plans to continue consultations during implementation
8. Institutional framework and arrangement for implementing resettlement
9. Grievance redress mechanisms
10. Costing and budget
11. Monitoring and evaluation.
Annex 12. Outline for Vulnerable and Indigenous Peoples Development Plan as per WB OP 4.10

a. A summary of the social assessment, including identification and mapping of indigenous communities in the project area.

b. A summary of results of the free, prior, and informed consultation with the affected Indigenous Peoples’ communities that was carried out during project preparation and that led to broad community support for the project.

c. A framework for ensuring free, prior, and informed consultation with the affected Indigenous Peoples’ communities during project implementation.

d. A summary project impacts on indigenous communities, including both positive and adverse impacts.

e. An action plan of measures to ensure that the Indigenous Peoples receive social and economic benefits that are culturally appropriate, including, if necessary, measures to enhance the capacity of the project implementing agencies.

f. An action plan delineating measures to avoid, minimize, mitigate, or compensate for adverse impacts.

g. Cost estimates and financing plan for the IPP.

h. Accessible procedures appropriate to the project to address grievances by the affected Indigenous Peoples’ communities arising from project implementation.

i. Implementation arrangements.

j. Mechanisms and benchmarks appropriate to the project for monitoring, evaluating, and reporting on the implementation of the IPP. The monitoring and evaluation mechanisms should include arrangements for the free, prior, and informed consultation with the affected Indigenous Peoples’ communities.
Annex B: Consultation minutes on the initial draft ToR for the ESIA, CIA and Social Planning Studies for Upper Arun and I khuwa Khola Hydropower Projects

Public Consultation Record

Consultation on the Terms of Reference for the Appointment of Consultant for the ESIA and CIA of Upper Arun and I khuwa Khola Hydroelectric Project

Background

The project site of Upper Arun Hydroelectric Project (UAHEP) is located about 700 km East of Kathmandu in Sankhuwasava District of Mechi Zone in the Far Eastern Development Region of Nepal. This project was identified during the master plan study of Koshi River Water Resources Development in 1985. The site was subsequently the subject of a reconnaissance study conducted by the NEA in summer of 1986. In 1987, feasibility study of this project was carried out by the Joint Venture of Morrison Knudsen Corporation, Lahmeyer International, Tokyo Electric Power Services Co. and NEPECON on behalf of Nepal Electricity Authority. The review study of this project was completed by Nepal Electricity Authority in 2011.

Upper Arun Hydroelectric project is a peakin g run of river type project. Intake of the project is located on left bank of Arun River near Chepuwa village. Three numbers of underground desanders are proposed just after the intake. The headrace tunnel is 7840 m long. The optimized diameter of the tunnel is 5.50 m and will be a circular in shape. Location and access for the adits will be reviewed depending on the access road. The surge shaft will be located on the hillside above the powerhouse and will have a finished diameter of 18 m. An underground valve chamber will be located immediately downstream of the surge tank and at the start of the vertical shaft. The 454 m long 2.80 m diameter vertical steel lined shaft and 60 m long 2.80 m diameter horizontal tunnels are constructed above the powerhouse. The underground powerhouse is located at the left bank of Arun River at Sibrung village. The installed capacity of the project is proposed to be 330MW.

I khuwa Khola Hydropower Project is located approximately 8 km downstream from the powerhouse site of Upper Arun HEP. This project is conceptualized to develop as an integral part of Upper Arun HEP for the social mitigation purpose. The feasibility study of the project is being carried out by the Department of Electricity Development.

NEA is planning to develop Upper Arun HEP and I khuwa Khola HEP (as an integrated part of Upper Arun HEP) at the earliest possible time. Hence, NEA is preparing EOI and RFP document to procure consulting services for engineering as well as environmental and social studies related to the project.
Presently, NEA has prepared Terms of Reference (ToR) for the social and environmental study using international consulting firms.

**Overview of the Consultation Event**

1. A public consultation was organized for all the stake holders by Nepal Electricity Authority on April 30, 2014 at the Radisson Hotel in Kathmandu on the draft Terms of Reference of Environmental and Social Assessment, Planning and Design studies for the proposed Upper Arun and I khuwa Khola Hydroelectric Projects. The purpose of the stake holders meeting were:
   (a) Disseminate project information to the stake holders
   (b) Share and receive feedback on draft Terms of Reference (TOR) prepared for the procurement of international consultant for Environmental and Social Assessment, Planning and Design to be carried out, as per the Government of Nepal and World Bank requirements and standards

2. NEA, the project owner, publicized the event through formal invitation on its web site: [www.nea.org](http://www.nea.org), letter/ fax/ e-mail to stakeholders. The list of invitees is attached on Annex 1.

3. The event was attended by Government Agencies, International Agencies & Donors, Academic Institutions, NGO’s & INGO’s, Local Representatives, Representatives of Tourism Sector & Experts. The full list of stakeholders in attendance is attached on Annex 2.

4. Stake holders meeting was started with the welcome speech by Mr. Upendra Dev Bhatta, Deputy Managing Director, NEA. He highlighted current energy crisis of the nation and role of Upper Arun HEP on mitigating the crisis. He also highlighted the importance of the Environmental Guidelines of Nepal Government as well as the guidelines of World Bank regarding project preparation and implementation. He has also focused on development of the I khuwa Khola Hydroelectric Project as the integrated part of the UAHEP for public participation.

The next welcome speech was delivered by Mr. Jie Tang (World Bank). He highlighted that the present energy crisis is due to the under investment in energy
sector. He suggested developing reliable, environmentally & socially sustainable & affordable projects in three different categories viz. short, mid & long term. He also focused on the World Bank investment (technical & financial) for both energy related private & public sector.

Technical presentation of both Upper Arun and I khuwa Khola HEP was presented by Mr. Bishwo Dhoj Joshi (Chief, PDD, NEA). The presentation mainly focused on Integrated Nepal Power System (INPS), technical aspects of Upper Arun HEP and I khuwa Khola HEP and further steps required for the timely implementation of the Project. Question and Answer session started followed by the presentation.

Presentation on "Social and Environment Assessment and Planning Requirements of GoN, World Bank and Upper Arun and I khuwa Khola HEP ESIA: Key elements of Draft ToR (Environmental and Social Assessment, Planning and Design Studies); Scope; Influence Area; key Potential Issues/concerns; VECs in the basin, process and timelines for execution, etc.” by Mr. Prakash Gaudel (Environmentalist, NEA). He highlighted the guidelines (GoN, World Bank, EPR etc.) to be following during study. He also highlighted on the World Bank Safeguard policies, Requirement of Consultation (WB and GoN), Independent Panels of Experts, who conduct the studies and activities, Methodology of study and how it relate to Engineering Design, Scoping of studies & specific Study outputs etc. After the presentation, Q&A and floor discussion session was started.

The whole program was filmed/recorded. Both Nepali & English languages were used to deliver the program. The hardcopy of presentations were distributed to the participants.

The total length of event was approximately 3 hrs.

Issues Highlighted by NEA

- NEA has incorporated benefit sharing at the local level as a guiding principle for hydropower project development. Benefit sharing was successfully integrated as a key component in the development of Upper Tamakoshi, which received wide support from a range of local stakeholders. Means for local development and benefit sharing will be explored extensively through the UAHP – IKHP joint project. IKHP is being studied and planned in tandem with
UAHEP as a mechanism to increase local ownership and share benefits of the project with the local community.

- NEA is keen to partner with the World Bank in developing UAHP as a public project owned by GoN, not with private sector involvement through the IFC.
- Due to the rural setting, social impacts of the project are anticipated to be minimal. The topography of the site also means that the flooded area will be minimal, with high firm power production considering overall environmental impacts. However, it is to be noted that the Makalu Barun Conservation Area is in the vicinity of the project site. Environmental and social impacts will be managed during project implementation in a way that mitigates negative impacts of the project and maximizes positive impacts.
- NEA is responsible for extensive coordination between the engineering and environmental consultants throughout the parallel process of the detailed engineering design and ESIA studies to ensure one informs the other. NEA will develop a coordination strategy that delineates this process and its role in the process, specifying also how inputs from the ESIA will be considered in the development of the detailed engineering design.

**Presentation on Technical Details of Project**

- Technical features of UAHP
  - Upper Arun captures Arun 4, 5 and 6 identified in the 1985 feasibility study; similarly Lower Arun captures Arun 1 and 2.
  - The UAHP site is strategic due to its proximity to load centers in the east, high head, and its potential of generating high firm power in relatively low project cost.
  - Major infrastructure development in the two decades since development in Arun Valley was first explored (through preparation of Arun III) – a fair weather access road has been constructed from Khadbari to Num. DoR is currently extending the road from Num to Kimathanka – this road is under construction and initial tracks from Num to Gola should be open in about four months, with further upgrading over the coming year. This road passes close to the UAHP power house site and will facilitate construction of the UAHP project.
  - An access road to the project site, constructed under the UAHP umbrella, will connect the Num-Kimathanka road from Gola to the UAHP power plant and then to the headworks location; it will involve a bridge and a tunnel. The current design of the road follows the alignment delineated in the initial feasibility study. It is necessary to build the access road before the rest of the project to allow project construction to commence. NEA’s ESSD is doing IEE. NEA will hire consultant for detailed engineering design of the access road.
o NEA is exploring, to be confirmed by the Consultants under the Project, three power evacuation options explored during update of feasibility study in 2011:

- Through the interconnection point at Tumlingtar (proposed Koshi Corridor 220 kV line to be implemented by the Exim bank) – preferred option among three; NEA estimates possible completion by 2021;
- Through Arun III plant’s substation;
- Through the substation at Duhabi (Terai).

• IKHP
  - IKHP is developed under the UAHP umbrella. It will allow locals to invest in a component of the UAHP through a PPP model.
  - Inception report submitted to NEA
  - DoED is conducting IEE and feasibility, expected to be completed by end of fiscal year

• Further steps
  - IEE for UAHP project access road has been contracted out to ESSD, NEA and is expected to be completed by 2015. Feasibility study of 1991 fixed the alignment of the road; no major changes in environmental/social conditions in the local area since then, hence current thinking on road alignment is the same. Local consultant to be selected for detailed design of access road and construction scheduled to be completed by end of 2017. Crucial to complete construction of access road before project construction commences.

Summary of comments, questions, and feedback received

The table below summarizes the key issues raised (including those not relevant to the proposed two projects) by stakeholders, and responses from NEA.

<table>
<thead>
<tr>
<th>Stakeholder category #1 (CENTRAL GOVERNMENT AGENCY OFFICIALS)</th>
<th>Remarks/Additional actions / agreed follow-up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stakeholder comment</td>
<td>NEA response</td>
</tr>
<tr>
<td>1. (WECS)</td>
<td></td>
</tr>
<tr>
<td>• Location not clear (Lat, Long)</td>
<td>• Suggestion taken</td>
</tr>
<tr>
<td>• Economic Analysis?</td>
<td>• Economic Analysis has been done but the presentation mainly focused on the technical aspect</td>
</tr>
<tr>
<td>• Given high head and firm water supply, what is the possibility of including reservoir and cascading power plants</td>
<td>• Due to very steep gradient of river, there are no possibilities of reservoir development.</td>
</tr>
<tr>
<td></td>
<td>• The ToR will be updated and discussed with more detailed information after the initial scoping work done by the Consultant, and will be disclosed again</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
to maximize power generation?
• TOR appears to be a general checklist. It has only grazed Makalu Barun. Not enough details are provided for us to provide feedback. This project is definitely going ahead; but with more detail, we would be able to provide inputs to manage impacts better.

<table>
<thead>
<tr>
<th>2. (DOED)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• DoED is conducting the feasibility study and environmental study of IKHEP – If NEA is again conducting studies on IKHEP, does this translate to double expenses and duplication of studies?</td>
</tr>
<tr>
<td>• Clarified that the study of Ikuwu Khola HEP shall wholly accepted by NEA as studied by DOED</td>
</tr>
<tr>
<td>Agreed that the feasibility study of Ikhuwa Khola HEP shall not be unnecessarily repeated thereby saving Govt. money.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>3. (Department of Mines &amp; Geology)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Where is the quarry site? Where will construction material be brought from? Current policy allows extraction of sand/gravel only from areas approved by the District Development Community. Since a large volume of material will be required for the project; a separate source might need to be identified</td>
</tr>
<tr>
<td>• Quarry site having IEE or EIA should only be selected.</td>
</tr>
<tr>
<td>• The Consulting services under the proposed Project: (a) detailed engineering and bidding design; and (b) ESIA, will cover these aspects and make proposals.</td>
</tr>
<tr>
<td>Agreed.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>4. (Ministry of Forest)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Access road, project site will affect forested areas. Clearance from the Ministry of Forest is a legal requirement: IEE or EIA alone is not enough. Coordination needed between consultants who</td>
</tr>
<tr>

</tbody>
</table>

6. (NEA)

- Difference in Annual Generation, why?

This is initial estimation based on the system demand, and will be reviewed and confirmed by the Consultants.

<table>
<thead>
<tr>
<th>Stakeholder comment</th>
<th>NEA response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Availability of detail</td>
<td>Appreciate sharing of data by ICIMOD.</td>
</tr>
<tr>
<td>Hydrological modeling &amp; GLOFs.</td>
<td></td>
</tr>
</tbody>
</table>
|---------------------------------
| • Agree to provide the required related information & data. |
| • Sharing of Knowledge. |
| • GLOF study is included as part of the ESIA. |

3. (INHURED)

- Why so late to process to implement UAHEP (After 23 yrs)?
- Public private ownership in Proposed Federalism? Who will own the project – the federal government/the local state government
- Due large catchment lies in China, consumptive/diversion of water may affect UPHEP (riparian rights both U/S & D/S)?
- GLOF study is included as part of the ESIA.

- The question is hard to answer here.
- The project study will be continued; later on state will decide ownership issue.
- There is no consumptive use of water at the UA catchment (within China).

3. (INHURED)

- There will be multiple activities and mobility of people/migration (inbound and outbound). There is possibility of increased security risks/crimes and impacts on local and indigenous people. A component is needed to manage this aspect.

3. (ISET Nepal)

- We are reviewing EIA for several projects. Two observations: (i) EIA documents are not accessible – please make project documents visible and easily accessible; (ii) Solid waste management Act and Local Self Governance acts need to be reviewed in the ESIA. Community upliftment plan is also needed.

- Separate web site already launched:
- All related acts & regulation shall be reviewed.
- Community development plan, which is to enhance benefits to all local communities, will be prepared in line with relevant WB Safeguard Policies. The final product will be disseminated in the NEA websites.

- Suggestion taken. Suggestion taken & Agreed.

4. (ICIMOD)

- Consideration of strategic environment impact assessment before conducting ESIA & CIA.
- ICIMOD has done a
- • SEA is included as part of the Project.
- • Appreciate sharing of data by ICIMOD.

- Suggestion taken. Mr. Jie Tang also added that WB is supporting NEA for two activities of this
detailed modeling of the hydrology of the project area, including impacts of GLOF, and impacts of any development in the region on flow regime. We would like to share our findings and contribute to project if given the opportunity particularly for GLOF studies.

Suggest expanding exploration beyond the area of influence (AOI) by using a strategic environmental impact analysis – which is not confined to a project approach, but takes a basin-wide approach. ICIMOD is eager to contribute to any exploration of effects of development in the basin – we have some resources. Lots of work done on EIA and CIA – these need to be reviewed during the study.

The proposed Project includes a basin-wide approach for river development planning and associated SEA.

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>The VECs should be properly selected so that the deliverable will not be another EIA instead of CIA.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>6. (INHURED)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clash between developers &amp; consumers. Need to be treated psychologically.</td>
</tr>
<tr>
<td>Deficit of Long term mitigation measures such as health, education etc. in affected area.</td>
</tr>
<tr>
<td>Political &amp; economical study may be impracticable issues.</td>
</tr>
<tr>
<td>ESIA governs the changes in pre-design project configuration.</td>
</tr>
<tr>
<td>CIA shall be done by higher level government body rather than project</td>
</tr>
</tbody>
</table>

Project -
- Detailed preparation and design of bidding documents
- ESIA process, which will provide inputs into detailed engineering design. The two processes will be conducted in parallel to allow engineering design to incorporate ways to minimize environmental impact.

5. (Hydro Consult)

Agree.

A major consultation on the TOR of the ESIA has reviewed the VECs and comments from a wide audience have been received.

6. (INHURED)

Suggestion taken. Through early consultation and benefit sharing options the project will engage with local communities to gain their support.

Yes, it will be part of the ESIA to be developed by the Consultants.

Will try.

ESIA and the project concept design go hand-in-hand and that is why two consulting firms will be hired and work in parallel, interacting with each other.

Agree. CIA and SEA will both done by Government Authorities.
Mr. Deepak Thapa (Social Science Baha:)

- The approach needs to go beyond meeting minimum requirements to delineate how to preserve cultural heritages and intangible assets (not only physical/tangible heritage) that will be lost because of project implementation.
- The presentation stated that consultations will be conducted at the VDC level. This is a huge project; a lot more consultations at various levels need to be carried out. Flow of information should be continuous and not be limited to consultations.
- A political economy analysis is absolutely necessary to understand the dynamic of the project area, inform benefit sharing etc.
- Stakeholder consultation should be continuous throughout the project.

<table>
<thead>
<tr>
<th>Stakeholder category #3 (Academic Institutions)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Stakeholder comment</strong></td>
</tr>
<tr>
<td>1. Mini &amp; Micro Hydropower Association</td>
</tr>
</tbody>
</table>

- Why NEA does not study the project itself?
  - One reason for slow/no progress is NEA does
  - While NEA will manage, participate and own the studies, given complexity and size of the studies required, this would over-stretch the capacity of the NEA in house team, so consultants need to be hired. In addition, contracting out will help to ensure greater independence in analysis.
  - Both engineering and ESIA for Upper Arun need to

- Agree that consultations and information disclosure will be conducted at various level as appropriate.
- Agree and the project will try to have a quality political economy analysis.
- Yes, as stated above.

Suggested to limiting on ESIA and CIA of the project.
none of the work itself. Why does NEA hire consultants to do the detailed engineering design for which initial feasibility study was conducted two decades ago? For microhydro, a single entity conducts design, construction, implementation etc. be updated in the current regional and country context, and need to be moved to the level of details ready for project implementation. Consultants will need to be hired to assist NEA in this work as stated above.

<table>
<thead>
<tr>
<th>Stakeholder category #4 (Tourism Sector &amp; Experts)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stakeholder comment</td>
</tr>
<tr>
<td>1. (NESS)</td>
</tr>
<tr>
<td>• Access road appears to be on slope at the edge of the Makalu Barun National Park. The area is rich in bio-diversity with dense vegetation. Access road will be disruptive to the conservation area, especially with the tunnel and large amount of spoils</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>2. (Mini &amp; Micro Hydropower Association)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• In the Nepali context, ESIA is more of a formality; it is not actually implemented. We need to focus on relevance and implementability rather than number of plans. Also, there should be coordination between plans: In the case of Bhotekoshi – plastics come in from Khasa and are collected/incinerated near the powerhouse – this is against Nepal’s waste management policy</td>
</tr>
<tr>
<td>• In the Nepali context again, resettlement is done, but not in an organized, equitable manner.</td>
</tr>
<tr>
<td>• TOR must ask to come up with a practical, equitable proposal on resettlement</td>
</tr>
<tr>
<td>• The proposed Project is designed for how resettlement process and benefit sharing could be improved.</td>
</tr>
<tr>
<td>• Agree. Under this project the ESIA and associated Action Plans will be part of the Hydropower and transmission line Projects to be implemented.</td>
</tr>
<tr>
<td>• This project will require minimal resettlement, but the RAP is expected to be detailed, following international guidelines and implementable in a locally practicable manner.</td>
</tr>
</tbody>
</table>
Can the entire road be constructed above the surface, possibly along the riverbank or make use of planned Koshi Highway on the other side of the Arun River (instead of constructing road on both side of the Arun River)?

2. (NESS)

- How will coordination between the engineering design and environmental design consultants be ensured? Why are they conducted in parallel?
- Clarity needed on the access roads and transmission lines. Are these components separate from the UAHP?
- Why International Consultant?

- The TORs define that the two firms will work hand-in-hand in parallel to ensure coordination. NEA will manage the contracts and ensure the coordination as defined in the TOR. Hiring of the two firms in parallel is exactly to ensure that both can work side by side to ensure coordination.
- Access roads and transmission line are integral parts of the UAHEP and will be assessed together with the hydropower project itself.
- to ensure learning from international experiences.

3. (NESS)

- Who will decide the scopes of VECs? Proponent, stakeholders, people etc.
- What % of water release for dry weather flow as environmental flow? e.g. special species of fishes.
- Effect on calculation of energy generation due to environmental release.
- Make a range of energy generation.

- Through stakeholder consultations.
- This is a question to be answered by the ESIA.
- Energy output will be assessed based on the minimum ecological flow is ensured.
- Yes, depending on the range of river hydrology regime.

<table>
<thead>
<tr>
<th>Stakeholder category #5 (Local Representatives)</th>
<th>Stakeholder comment</th>
<th>NEA response</th>
<th>Remarks / Additional actions / agreed follow-up</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Upper Arun Local Representative</td>
<td>Ikhuwa Khola is very suitable for energy generation. Local inhabitants have a tendency to oppose new development initiatives; I am committed to mediate</td>
<td>Yes. Thanks for such support, which is absolutely needed.</td>
<td>Agreed.</td>
</tr>
</tbody>
</table>
local objections/discord at the local level and do all I can to facilitate smooth project implementation.

2. (CA Member, Sankhuwasabha)

- Thanks to WB & NEA.
- Anticipation to complete the project on 2017/2018 AD.
- As a locally elected representative, I want to ensure you that local community and local political parties will not oppose the project in any way. I take the responsibility of resolving any conflicts/opposition at the local level. We have formed a local body, consisting of all local political parties, with the purpose of not allowing private development of areas inherent to UAHP. We will not allow caste etc. to be used as an excuse to oppose the project. Since IKHP is a small component, we urge you to start this component before UAHP. IKHP is close to DoR’s road, hence should be easy to construct.

- Thanks for supporting.
- Yes this is the timeline planned for the preparation of the UAHEP and other investment projects.
- Thank you for ensuring the local support and support by the political parties. We will continue engage with you and all other stakeholders to ensure support of and benefit sharing with the local communities.

**Stakeholder category #6 (Media Representatives)**

<table>
<thead>
<tr>
<th>Stakeholder comment</th>
<th>NEA response</th>
<th>Remarks / Additional actions / agreed follow-up</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Environmental Journalist)</td>
<td>The project should proactively use the media for stakeholder consultations, and to take the word to the local level. Proactively use the media. Do not see stakeholder consultation as a formality; the project can be made</td>
<td></td>
</tr>
<tr>
<td>The Project will engage meaningful consultation with all stakeholders and proactively approach the media for information disclosure and consultation and support. Today’s consultation meeting, at the earliest stage of the project preparation, is also a part of public consultation process for the project</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
better through stakeholder input. The people have a legal right to information through the Right to Information Act.

- Rainfall patterns have changed because of climate change. Let us not assume that water availability will not change in the future. The impact of Climate change on hydrology needs to be assessed. This project needs robust planning. Dam/power house safety needs to incorporate climate change concerns.

- Sedimentation in the Koshi River is very high; sediment concerns need to be incorporated.

- Who will do the monitoring of the ESIA implementation? Besides the key players mentioned in the ILO 169, local inhabitants should also be involved during the project preparation and implementation.

- A separate Climate Change Impact assessment for all hydropower in South Asia region including Nepal, is underway, supported by the World Bank. The Project design and ESIA will take into account of the climate change effect.

Agree.

- The ESIA will define the monitoring mechanism as needed, NEA monitor the ESIA implementation and local stakeholders will be engaged.

**Event Closing**

The event closed at 12:40 PM by thanking the stakeholders for their attendance and participation. They were also informed about the future plans for continuing consultation and engagement related to the projects, place where information about the projects’ planning and development could be retrieved (http://www.nea.org.np/publications.html), and how to get in touch with NEA with any further questions, concerns or suggestions:

The program was wrapped up with closing remarks of Mr. Arjun Kumar Karki, Managing Director, NEA. He thanked all participants for their valuable suggestions and thanked World Bank for their support to develop Upper Arun Hydropower Project. He showed his commitment to execute ESIA & CIA under the relevant guidelines of Nepal Government and
World Bank. He promised to address local issues and assured the local participation in Ikhuwa Khola HEP. He also highlighted the importance of UAHEP in INPS and also anticipated that UAHEP will not face the same faith as of Arun III. He urged World Bank to develop UAHEP as public project and clarified that NEA could not and will not develop UAHEP in the company format. The project components will be determined as per geological condition & it will be more or less intact as per previous study. Finally, one more time, He heartily thanked to all participants & hoped to complete the UAHEP within schedule time of 2021/2022 AD.

Participants were furthermore informed that this summary would be made publicly available (both in English and Nepali) at NEA’s website within 45 days of the event.

Conclusions and Recommendations on draft TOR

- **Modifications needed in the draft TOR in response to all the questions raised and responses provided by NEA as provided in the Matrix above, which will include but not limited to:**
  - Clarify purpose of IKHP in the TOR – change from provision of electricity to UAHP construction to benefit sharing mechanism with local community.
  - Clarify construction power to be supplied by diesel generator – specify capacity, need for fuel management/noise management etc.
  - Update transmission line info with NEA’s current thinking – Koshi Corridor transmission line up to Khadbari (financed by Indian EXIM bank), NEA to extend a 220kV line 45km to UAHP site. Koshi Corridor presumed to be a “linked” activity, to be covered in the studies.
  - Clarify transmission line approach for IKHP.
  - Clarify that access road for UAHP will be packaged separately from the rest of the project, since access road needs to be completed (hence fast-tracked), before project construction can begin. Access road for IKHP meanwhile would be covered as part of the ESIA for that component.
  - Clarify that currently considered project access road alignment is derived from the initial feasibility study, and that ESIA to be commissioned by NEA will explore environmental implications for this alignment as well as for alternative alignments.
  - Add IKHP Inception Report, available to NEA, to the list of documents to be provided to the consultant.
Clarify how the coordination between engineering design and E&S consultants will be done by NEA in practice. Key issues in particular requiring coordination are: alternatives analysis, determination of environmental flow, etc.

Clarify the “Phase 1” and “Phase 2” approaches given that alternatives analysis needs to also continue during the ESIA process, as the detailed engineering design process unfolds in parallel. Rework this to clarify the iterative nature of the alternatives analysis on the design and construction aspects that are still to be determined.

Other agreed next steps

NEA to develop communications strategy related to the project and studies underway ASAP, to keep stakeholders proactively informed about project progress and upcoming consultation and engagement opportunities. This will include project website among other elements.

Commission fisheries expert ASAP to review existing information and scope the baseline data collection process, methodology, locations, etc., and to start the baseline data collection immediately rather than waiting for full consultancy to be awarded.

NEA to commission Panel of Experts.

(see project File, NEA)
Annex C: Consultation minutes on this ESMF for the Power Sector Reform and Sustainable Hydropower Development Project

THE WORLD BANK GROUP

PUBLIC CONSULTATIONS RECORD

DRAFT ENVIRONMENTAL SOCIAL MANAGEMENT FRAMEWORK (ESMF) FOR POWER SECTOR REFORM AND SUSTAINABLE HYDROPOWER DEVELOPMENT PROJECT (PSRSHDP)

12/23/2014
Background:
The proposed Nepal Power Sector Reform and Sustainable Hydropower Development Project (PSRSHDP) intends to develop technical and analytical studies, capacity-building activities and policy dialog on the energy sector in Nepal, and preparation of next-step critical hydropower and transmission line projects to prepare Nepal for upcoming large-scale private and public investments in hydropower.

The Objectives of POWER SECTOR REFORM AND SUSTAINABLE HYDROPOWER DEVELOPMENT PROJECT are to strengthen the capacity of (a) the power sector agencies to plan and prepare hydropower and transmission line projects following international standards and best practices; and (b) the GON agencies to improve the policy, legal and regulatory framework for sustainable water resource management and hydropower development.

This Project intends to offer a holistic and coherent set of technical and analytical studies, capacity-building activities and policy dialog on the energy sector, and preparation of next-step critical hydropower and transmission line projects to prepare Nepal for upcoming large-scale private and public investments in hydropower.

The proposed Project has three components: (i) Preparation of Hydropower and Transmission Line Investment Projects; (ii) Studies for Policy Recommendations and Sector Reform; and (iii) Capacity Building for Safeguard Management and Hydropower Development. More information is provided below on the components:

- **Component A: Preparation of Hydropower and Transmission Line Investment Projects** (IDA Credit $20 million). The GoN has officially proposed the Upper Arun Hydro Electric Project (UAHEP - 335 MW) and Ikhuwa Khola Hydro Power Project (IKHPP - 30 MW) for Bank support for project preparation. This component will support preparation of two hydropower projects as proposed by the GoN, and one cross-border high voltage transmission line project following recommendations of the Transmission System Master Planning supported under the on-going NIETTP. Preparation of projects
will follow international standards and World Bank Safeguard Policies for preparation of project design, bidding documents, and environmental and social impact assessment and mitigation planning, and support construction supervision and management of these projects.

- **Component B: Studies for Policy Recommendations and Sector Reform** (SAWI Grant US$2.0 million and PPIAF Grant US$2.0 million). This component will address critical power sector issues. This component will support preparation of (a) Power System Expansion Strategy, including a Generation Master Plan (PPIAF); (b) an action plan for NEA institutional restructuring (PPIAF); (c) integrated water resource planning and management to guide sustainable hydropower development (SAWI); (d) revised Electricity Act and Regulatory Commission Act (PPIAF); (e) streamline of forestry clearance process and procedures (PPIAF); and (f) GoN policies to facilitate private investment in hydropower and transmission line, e.g. the need of GoN guarantee (PPIAF); (g) a road map for establishment of power sector regulatory institution; and (h) power trading strategy and associated capacity building. It will prioritize and sequence study recommendations for actions, build consensus and enhance capacity for follow-on implementation under the planned DPC operations.

- **Component C: Capacity Building for Safeguard Management and Hydropower Development** (SAWI Grant US$0.5 million, PPIAF Grant $0.5 million). The component will support improving the environmental and social safeguard management system and associated capacity building, including:
  b) Preparation of recommendations for updating environmental and social regulations and procedures for hydropower development, covering the following areas:
  - Cumulative/strategic impact assessment, including minimum ecological flows, in a basin-wide approach;
  - Hydropower resettlement and benefit sharing and gender equality; and
  - Adoption of recommendation for mitigating impacts of climate change on water resources and hydropower, which is being reviewed through an ongoing Bank funded TA (results will be shared in 2015).
  c) Preparation of NEA corporate policy for compensation of transmission line ROW;
Safeguard capacity-building, including capacity building in understanding the impacts of climate change and disaster risk management in hydropower planning and operations, and support to NEA, WECS, MoE and other GoN agencies for development of hydropower and associated facilities.

The public consultation program was organized as per World Bank guidelines.

Overview of the consultation event

1. A public consultation was organized on Environmental and Social Management Framework (ESMF) by Water and Energy Commission Secretariat, Department of Electricity Development, and Nepal Electricity Authority on December 23, 2014 at the Yak and Yeti Hotel in Kathmandu. The objectives of the stakeholders meeting were to inform and discuss with the stakeholders about the Environmental and Social Management framework prepared for the proposed Nepal Power Sector Reform and Sustainable Hydropower Development Project (PSRSHDP).

2. NEA, on behalf of the Government of Nepal, publicized the event through a general announcement on its web site at www.nea.org.np, as well as through formal invitation via letter/ fax/ e-mail to specific key stakeholders to encourage their attendance. The list of invitees is attached on Annex 1. The event was attended by Government Agencies, International Agencies & Donors, Academic Institutions, NGO’s & INGO’s, Local Representatives, Representatives. The full list of stakeholders in attendance is attached on Annex 1.

3. Stakeholders meeting commenced with the welcome speech by Mr. Lila Nath Bhattarai, Acting Deputy Managing Director, NEA. He highlighted the objectives of meeting as to disseminate information on proposed power sector reform and sustainable hydropower development and to obtain feedback on both objectives and draft environmental and social management framework. This consultation program is intended to maximize benefit from proposed projects with nominal impacts and improve project consultation process.
4. Technical presentation of Component A of the proposed Technical Assistance (TA) project, in particular the proposed Upper Arun Hydroelectric Project (UAHEP) and the proposed Ikuwa Khola Hydropower Project (IKHPP), was presented by Mr. Sanjib Man Rajbhandari (Manager, PDD, NEA) and Mr. Rabindra Chaudhary (Manager, ESSD, NEA). The presentation mainly focused on technical, environmental and social aspects of UAHEP and IKHPP. The presentation followed the Question and Answer session which was actively participated. This discussion built upon a previous dedicated consultation event that was hosted by NEA on April 30, 2041 in Kathmandu on the draft Terms of Reference (TOR) for the environmental and social studies to be carried out for UAHEP and IKHP.

5. In addition, the key elements of Components B and C of the proposed TA project, their potential environmental and social aspects and implications, and the manner in which these aspects will be further studied and treated through the studies and activities under the project, were presented by NEA, and discussed with stakeholders. The proposed consultation and disclosure aspects of all studies, planning and capacity building activities through the proposed TA were also discussed, and feedback solicited from stakeholders.

6. Audio and video recording of the whole consultation has been done. The presentation and discussion was facilitated in both Nepali & English languages for better interaction and communication. The hardcopy of presentations were distributed to the participants. The duration of the program was approximately for 2 hrs.

**Technical Presentation the UAHEP and IKHPP Projects (to be prepared through Component A of the proposed TA)**

**Technical features of UAHEP**
- Upper Arun captures Arun 4, 5 and 6 identified in the 1985 feasibility study; similarly Lower Arun captures Arun 1 and 2.
- The UAHEP site is strategic due to its proximity to load centers in the east, high head, and its potential of generating high firm power in relatively low project cost.
- Major infrastructure development in the two decades since development in Arun Valley was first explored (through preparation of Arun III) – a fair weather access road has been constructed from Khadbari to Num. DoR is currently extending the road from Num to Kimathanka – this road is under construction and initial tracks from Num to Gola should be open in about four months, with further upgrading over
the coming year. This road passes close to the UAHEP power house site and will facilitate construction of the UAHEP project.

- An access road to the project site, constructed under the UAHEP umbrella, will connect the Num-Kimathanka road from Gola to the UAHEP power plant and then to the headworks location; it will involve a bridge and a tunnel. The current design of the road follows the alignment delineated in the initial feasibility study. It is necessary to build the access road before the rest of the project to allow project construction to commence. NEA’s ESSD is conducting IEE of the proposed access road. NEA will hire consultant for detailed engineering design of the access road.

- NEA is exploring three power evacuation options explored during update of feasibility study in 2011. The selection of the preferred option will include consideration of environmental and social aspects and will be further studied through in detail through the proposed TA, including all environmental and social impacts and management aspects:
  - Through the interconnection point at Tumlingtar (proposed Koshi Corridor 220 kV line to be implemented by the Exim bank) – currently preferred option among three; NEA estimates possible completion by 2021.
  - Through Arun III plant’s substation
  - Through the substation at Duhabi (Terai)

- IKHPP
  - IKHPP will be developed under the UAHEP umbrella. It will allow locals to invest in a component of the UAHEP through a PPP model.
  - Inception report submitted to NEA
  - DoED is conducting IEE and feasibility, expected to be completed by end of fiscal year. The overall environmental and social assessment and planning studies for UAHEP will also include IKHPP, to complement the IEE and ensure international standards are met.

- Further steps
  IEE for project access road has been contracted out to ESSD, NEA and is expected to be completed by 2015. Feasibility study of 1991 fixed the alignment of the road; no major changes in environmental/social conditions in the local area since then, hence current thinking on road alignment is the same; however, this will be confirmed through the studies being undertaken, and adjustments made as appropriate to minimize social and environmental impacts. Local consultant
to be selected for detailed design of access road and construction scheduled to be completed by end of 2017. Crucial to complete construction of access road before project construction commences.

Summary of presentation and discussion on Components A, B and C of the project, including overall consultation and disclosure arrangements for the overall project

The table below summarizes the key issues raised (including those not relevant to the proposed two projects) by stakeholders, and responses from NEA.

<table>
<thead>
<tr>
<th>Stakeholder comment</th>
<th>Response</th>
<th>Remarks/Additional actions / agreed follow-up</th>
</tr>
</thead>
<tbody>
<tr>
<td>7. USAID</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Details of Panel of Experts to be selected</td>
<td>Two panels of experts-Technical (Dam Safety) and Environmental-Social.</td>
<td>Suggestion well received and will be incorporated</td>
</tr>
<tr>
<td>- How will be the selection process?</td>
<td>Following the WB procurement process for hiring experts.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>8. Indigenous Peoples Representative</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Right of Indigenous people are to be included in project involvement</td>
<td>The stakeholder consultation includes consultation with indigenous and vulnerable community along with others.</td>
<td>Suggestions will be incorporated during the project study and implementation time</td>
</tr>
<tr>
<td>- Concerned in definition of local, why indigenous is not stated.</td>
<td>A vulnerable and indigenous and peoples development plan will be prepared for the project in line with relevant WB Policies</td>
<td></td>
</tr>
<tr>
<td>- Timely information on to Indigenous people shall decrease any future conflict.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Holistic approach to project implementation and Local Indigenous involvement.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Engagement of IPs at each level of project implementation</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>9. Association of District Development</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Why not equity of local</td>
<td>Nepal Government’s Cabinet has decided to develop UAHEP by NEA</td>
<td></td>
</tr>
<tr>
<td>people, corporate house and national banks in case of UAHEP, why development partners are considered for this project?</td>
<td>under the ownership of Nepal Government. Hence, the project share could not be distributed to local people. UAHEP being one of the attractive projects financially, the benefit of these resources should not be directed to any particular organization or private parties. Instead, the consumers in particular and country as a whole should benefit from such potential and attractive project. With regards to the ownership of UAHEP meeting was held with local representative and assembly member and concurrence was made to develop IKHPP along with UAHEP and hand over the total ownership of IKHPP to the local public. Fund form local resources for the project shall not be enough if project will be developed up to 800 MW (in Q-40) or more, thus fund from World Bank is required.</td>
<td></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>Why benefit sharing only in IKHPP not in UAHEP?</td>
<td>The detailed engineering design, ESIA and CIA studies will address this issue more deeply</td>
<td></td>
</tr>
</tbody>
</table>

10. Investment Board of Nepal
- What are challenges associated with UAHEP considering the conservation areas nearby the construction sites?
- How closely UAHEP is working with Arun-3?
- Does UAHEP affect the Arun 3 which is in downstream?

The construction site only touches the buffer zone of the Makalu Barun National Park. However, NEA has already applied for permission at relevant agency and recommendation will be followed as required. In addition, the full ESIA will further study the potential impacts to the park’s buffer zone and any other critical habitats, and will ensure appropriate mitigation, management and offsets if required, in accordance with World Bank and national requirements and policies.
<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>How closely UAHEP is working with Arun-3?</td>
<td>UAHEP as well as Arun III both are designed as few hours peaking type. The River basin Plan/Generation master Plan to be supported under this Project will coordinate the operation of these two projects on the same river.</td>
</tr>
<tr>
<td>Does UAHEP affect the Arun 3 which is in downstream?</td>
<td></td>
</tr>
<tr>
<td>11. NAARC</td>
<td></td>
</tr>
<tr>
<td>• Presentation was more focused in the UAHEP &amp; IKHPP Technical part.</td>
<td>This document is framework covering the brief activities of the project and environmental and social documents to be prepared for the project. The proposed ESIA of the proposed Project (PSRSHD) will develop a monitoring mechanism for all projects supported under the proposed Project. The ESIA will follow both applicable national policies and WB Safeguard Policies as well.</td>
</tr>
<tr>
<td>• What about monitoring mechanism within the framework?</td>
<td></td>
</tr>
<tr>
<td>• What is the consideration on National Policies regarding project?</td>
<td></td>
</tr>
<tr>
<td>Suggestion is welcomed. Will be address during out environmental study</td>
<td></td>
</tr>
</tbody>
</table>
12. IPPAN

- Why is road planned from Tumlingtar, not from Basantapur?
- Why the local ownership (share) model is for Ikhuwa only why not in UAHEP?
- There must be incorporation of local people
- International Practice in these development
- By international donor is slowing down the project.
- International practice is only concentrated in the process not in the outcome.
- Why cannot financial fund be arranged from local level?

Access road alignment will be finalized during Detail Engineering Design Phase, and in consideration of findings of the ESIA. UAHEP is sole government owned project. NEA is developing agency on behalf of GoN. Even NEA will not get sole benefit. Government, general consumers and the whole tariff system will be benefitted from this project. IKHPP is integrated part of UAHEP and they should not treated as individual project. So, there is no question of local share in UAHEP only. UAHEP is still under study. If its capacity is finally determine to be 800MW (Q40) or 2000MW (Q25 design) financing from local level may not be possible.
13. Forest Department

- Environment study should be updated.
- Consultants conducting the studies are in practice centrally based; and in many cases the information collected are not site specific and the sites are not visited and the genuine affected people are seldom consulted during the process.
- Forest department is being blamed for not giving clearance for project. But actually the EIA (for projects, in general) are not comprehensive.
- There is no regular consultation and coordination at all level of project planning and implementation

<table>
<thead>
<tr>
<th>The existing environment and social documents will be updated at different level of studies to be commissioned under the proposed project. A bankable report will be prepared for this project following GoN and World Bank requirements. This includes robust stakeholder consultations, requirement for detailed fieldwork and in-depth site-specific analyses and management plans.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Suggestion will be incorporated during environmental study.</td>
</tr>
<tr>
<td>14. Department of Soil Conservation and Watershed Management</td>
</tr>
<tr>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td>• Land use management, Restoration, Reform, Catchment management including upper catchment should be dealt in integrated way for sustainability of project.</td>
</tr>
<tr>
<td>• New techniques like Payment for Environmental Services (PES) needs to be investigated with regard to benefit sharing</td>
</tr>
<tr>
<td>The ESIA will address watershed management issue at project level whereas the cumulative impact assessment will cover the watershed management issue in wider aspect.</td>
</tr>
<tr>
<td>Suggestion will be incorporation during detailed engineering design and environmental study</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>15. Ministry of Energy</th>
</tr>
</thead>
<tbody>
<tr>
<td>• What about dewater zone created by project at buffer zone of Makalu Barun Conservation Area?</td>
</tr>
<tr>
<td>• Does the access road lies within Makalu Barun Conservation Area?</td>
</tr>
<tr>
<td>• How was capacity of IKHPP determined as 30 MW?</td>
</tr>
<tr>
<td>Barun River is at about 14 km downstream from headworks. Required discharge as suggested by environmental study will be released. Entire access road is at the left bank of Arun River which is away from the Buffer zone of Makalu Barun Conservation Area. Installed capacity of IKHPP confirmed as 30MW as per review study of DoED.</td>
</tr>
<tr>
<td>Detailed study will be carried out during detailed engineering study and environmental study</td>
</tr>
</tbody>
</table>
16. NAARC
- What has been considered about G-flow (Genetic Flow)?

Investigation under process. Later it will be incorporated. It will be addressed by environmental study. Ecological flow management plan will be prepared as a part of Environment and Social Management Plan.

17. Investment Board
- During Hydropower development, Environment act is followed. Is same act followed for both small and large hydropower projects?

Small<500MW, Large>500MW.

The act is only guiding document and the details will be covered as per the approved ToR, existing guidelines and prevailing practices. The EIA guideline for energy sector is still at draft stage and needs to be finalized at earliest.

Study will be carried out to meet the requirements of Nepal Government as well as donor agency.

18. WECS concluding remarks
The activities in Component C (to support the decision system) is too many- this should be made concise so that outcomes/results are seen

Follow-up discussion and coordination will be carried among WECS, DOED, NEA and the WB to ensure consensus.

Event Closing

The event closed at 12:40 PM by thanking all the stakeholders for their kind attendance and active participation. The program was wrapped up with closing remark by Mr. Lila Nath Bhattarai (Acting DMD, NEA) and Dr. Sanjay Sharma (Joint Secretary, WECS). Both of them thanked all participants for their valued suggestions and for making the event successful.
Mr. Lila Nath Bhattarai explained that UAHEP project has been conceptualized as one of the potential project which can reduce the overall cost of energy production. Currently, 3/4 of the total installed capacity of Nepal is owned by NEA, even in this situation, NEA is struggling to improve its financial health, so this project is very important for NEA and to the country. IKHPP will be developed as an integrated part of Upper Arun and all of its ownership will be handed over to the local people however the mode of transfer will be decided in near future.

Dr. Sanjay Sharma focused on sustainable development of the project by the policy level changes. He also focused on involvement, consent, acceptance, information to the local people as an essence of successful development of hydropower projects. Finally, He heartily thanked to all participants for successful participation and provision of feedback about the proposed TA project.
Annex 1: Detailed list of consultation participants

In total 43 persons from all the three implementing agencies, GoN authorities, local environmentla and socially experts / consulting firms, independent hydropower developer associations, local NGOs, development partners, and the World Bank, participated the consultations. Name list, organization, detailed contact information are available in the Project file (NEA, WECS and DOED)

सारांश

ऊर्जा क्षेत्र सुधार तथा दिगो जलविचुति विकास परियोजना (PSRSHDP)
को लागि

वातावरणीय तथा सामाजिक व्यवस्थापन रुपेखा (ESMF)
पृष्ठ/भाग २०७

क. पृष्ठभूमि

प्रस्तावित नेपाल ऊर्जा क्षेत्र सुधार तथा दिगो जलविचुति विकास परियोजना (PSRSHDP) ले नेपाललाई ऊर्जा सम्बन्धी सम्पूर्ण प्राविधिक तथा विश्लेषणात्मक जान, सीप तथा नीतिगत सहयोग प्रदान गरी भविष्यमा जलविचुति तथा प्रशारण लाइन परियोजनाहरूमा ठूला लगानीको उपयोग गर्न सक्षम बनाउने लक्ष्य लिएको छ। यस परियोजनालाई विश्व रुपमा परामर्श सेवा प्रदान गर्दै र कुनै पनि अवस्थामा कुनै पनि निर्माण कायम वा भौगोलिक संरचना सम्पन्न गर्दै आर्थिक सहायता उपलब्ध गराउने। परियोजनाका नियामकलापहरु नेपाल सरकार र विश्व बैंकका सामाजिक तथा वातावरणीय नीति नियमहरु वमोजिम छन् र भने कुनै सुनिश्चित गर्दै नेपाललाई ऊर्जा क्षेत्रमा लगानी मैत्री वातावरण बनाउन र परियोजनाको सकारात्मक कार्यक्रम बढाउन यस वातावरणीय तथा सामाजिक व्यवस्थापन रुपेखाले विभिन्न प्रावधान, प्रक्रिया, जिम्मेदारीहरूको खाका तयार गरेको छ।

यस सारांशमा प्रस्तावित परियोजनाको वातावरणीय तथा सामाजिक व्यवस्थापनका प्रमुख पक्षहरु उल्लेख गरिएको छ। यस सम्बन्धी विस्तृत जानकारी ESMF (ईएसएमएफ) को पूर्ण पाठसहित यसका अनुसूचीहरूमा दिइएको छ। ईएसएमएफको पूर्ण पाठ निम्न लिखित वेबसाइटहरूबाट डाउनलोड गर्न सकिनुहोस्।

NEA: http://www.nea.org.np/publications.html
ख. परियोजनाको संक्षिप्त विवरण

यस परियोजना विकासका उद्देश्यहरू देखाय बमोजिम छन्।

(क) अन्तराष्ट्रिय मापदण्ड तथा असल अभ्यासहरूको अनुसरण गरी जलविषुव्त तथा प्रशासन लाईन परियोजनाहरूको योजना तत्कालीन गर्न उग्र श्रेणीक निर्माणहरूको क्षमता अभिवृद्धि गरेको छ।

(ख) दिगमा जलस्रोत व्यवस्थापन तथा जलविषुव्त विकासका लागि नीतिगत, कानूनी तथा नियमनको हाँचा सुधार (तयार) गर्ने नेपाल सरकारका निर्माणहरूको क्षमता अभिवृद्धि गरेको छ।

प्रस्तावित परियोजनाको तीनवटा खण्ड (Component) रहेका छन्: (क) जलविषुव्त तथा प्रशासन लाईनमा लगानी गर्न योग्य परियोजनाहरूको तयारी (इडा) २ करोड अमेरिकी डलर ऋण सहयोग)।

• खण्ड “क”: जलविषुव्त तथा प्रशासन लाईन लगानीमा लगानी गर्न योग्य परियोजनाहरूको तयारी (इडा) २ करोड अमेरिकी डलर ऋण सहयोग)।

• खण्ड “ख”: नीतिगत सुभाष्टरहन तथा श्रेणी सुधारका लागि अध्ययन (साबी, र पीपीआइएफ २ करोड लाख अमेरिकी डलर अनुदान सहयोग)।

• खण्ड “ग”: बातावरणीय तथा सामाजिक व्यवस्थापन तथा जलविषुव्त विकासका लागि क्षमता विकास (साबी, र पीपीआइएफमा ५/५ लाख अमेरिकी डलर अनुदान सहयोग)।

ग. पालना गर्नुपर्ने बातावरणीय तथा सामाजिक प्राधान्यहरू

खण्ड “क” मा गरिने अध्ययनको मूल विषय हो- भविष्यमा लगानी गरिने पूर्वाधार। यसका साथै प्रस्तावित परियोजनालाई नीतिगत सुधार गर्न तथा एकीकृत जलाधार (Basin) योजनाहरू बनाउन सहयोग गन्छ। यी क्रियाकलापहरूबाट पनि बातावरणीय तथा सामाजिक प्रभाव बा असर (सकारात्मक बा नकारात्मक दुवै) व्यापक हुनसक्छ। त्यसैले नकारात्मक प्रभावहरूको जीवित न्यूनीकरणका उपायहरूको परिवर्तन गर्न र सकारात्मक असरहरूलाई मजबूत बनाउन बातावरणीय तथा सामाजिक प्रभाव मूल्यांकन तथा जीवित न्यूनीकरण योजनाहरू संचालन गरिनेछ। उक्त कार्य नेपालको आफने बातावरणीय तथा सामाजिक प्राधान्यहरू, नीति, नियम तथा स्वीकृत प्रक्रिया, र नेपाल सदस्य रहेको तथा यसले अनुमोदन गरेका अन्तराष्ट्रिय अभियंताहरूको अधिनमा रहेका सम्पन्न गरिनेछ। साथै यस परियोजनामा विश्व बैंकको लगानी रहने प्रस्ताव गरिएको यस परियोजनालाई विश्व बैंक सम्बन्धि बातावरणीय तथा सामाजिक नीतिहरूमा उल्लेख गरिएको प्राधान्यहरूको पालना गर्नुपर्ने छ। विश्व बैंकको कार्यस्थलका नीति (World Bank Operational Policy) ४.०७ वमोजिम यस परियोजनालाई “क” वर्गमा मा राखिएको छ। विश्व बैंकका नीतिहरूको पालना गर्न बातावरणीय तथा सामाजिक प्रभाव मूल्यांकन तथा व्यवस्थापन योजनाको सुनिश्चितता गर्नुपर्नुहुनै विस्तृत

1 अन्तराष्ट्रिय विकास समथा
2 साउन एस्था बाट इन्किमयार्ड
3 प्रशिक्ष-प्राइवेट इकाइका एकडे मोड्याउँदै फायलमिनिट
ढौजनियैरिड डिजाइनको तयारीका लागि खबरे सरोकारवाहस्तम्थ परामर्श गरी खबरे “क” अन्तर्गत प्रस्ताव गरिएका जलविचुति तथा प्रशासन प्लानमा हुने लगायतको वातावरणीय तथा सामाजिक प्रभाव मूल्याङ्कन कार्य समेत सम्मन गर्नुपर्ने हुन। विशेष बैठकमा निर्धारण गर्ने मापदण्ड अनुसार खबरे “क” र “ग” अन्तर्गत प्रस्तावित जलाशय योजना तथा नीतिगत सुधार अध्ययन र त्रियाकलापहरू गरी सरोकारवाहालहरूको व्यापक परामर्श तथा सहभागिता आवश्यक पर्दछ।

घ. खबरे “क” अन्तर्गत तयारीका लागि छानिएका योजनाहरूको वातावरणीय तथा सामाजिक स्वल्पहरू

नेपाल सरकारले खबरे “क” अन्तर्गत तयारी अध्ययनका लागि माथिल्दो अरुण (३३५ मेगावाट) जलविचुति परियोजनाला र इखुबा खोला (३० मेगावाट) जलविचुति परियोजना प्रस्ताव गरेको छ। माथिल्दो अरुण जलविचुति परियोजना संख्यासम्बन्धी जिल्लाको अरुण नदीमा रहने प्रस्ताव गरिएको छ। माथिल्दो अरुण जलविचुति परियोजना जलविचुति परियोजनाको विभाग (पावरहाउस) वाट करिएको ५ किलोमिटर तल अरुण नदीमा सहायक नदीमा रहेको छ। (उल्लेख दुवै परियोजनाको प्रस्तावित स्थान अनुसूची को मा भएको नक्शामा देखाइएको छ)। स्वागतीय समूहहरूको लागि लाम बॉडफॉक्ड (Benefit Sharing) गरेको व्यवस्था गर्न तथा उनीहरुलाई विचुति आपूर्ति उपलब्ध गराउन इखुबा खोला जलविचुति परियोजना र माथिल्दो अरुण जलविचुति परियोजना एकसाथ तयार गरी अधि बढाइएको।

प्रस्तावित परियोजनाको कार्यचयनका चरणमा नेपाल सरकारले घर एक प्रशासन लाइनको समेत पहिचान गरेको।

ङ. प्रस्तावित परियोजनाको कार्यचयनका बेला गरिन्तुनेमार्ययन र वातावरणीय तथा सामाजिक दस्तावेज (Safeguard Instruments) को सूची तथा क्षेत्र

ङ. १. तयारी अध्ययनका कम्पन माथिल्दो अरुण तथा इखुबा खोला जलविचुति परियोजनाहरूको लागि निम्न लिखित वातावरणीय तथा सामाजिक दस्तावेजहरू तयार गरिएको:

- माथिल्दो अरुण तथा इखुबा खोला जलविचुति परियोजना दुवैका लागि वातावरणीय तथा सामाजिक प्रभाव मूल्याङ्कन (ESIA)
- माथिल्दो अरुण जलविचुति परियोजनाको लागि वातावरणीय तथा सामाजिक व्यवस्थापन योजना (ESMP)
- इखुबा खोला जलविचुति परियोजनाको लागि वातावरणीय तथा सामाजिक व्यवस्थापन योजना (ESMP)
- अरुण नदी जलाशयको समग्र प्रभाव मूल्याङ्कन (CIA)
- पूर्ववास सम्बन्धी नीतिगत रुपरेखा (RPF)
- पूर्ववास कार्ययोजना (RAPs)
• जीविकमा रहेका तथा आदिवासी मानिसहरूको विकास योजना
• तल्लोलटीय प्रभाव व्यवस्थापन योजना
• लैंगिक मूल्यांकन तथा कार्ययोजना
• लाभ वाणिज्यको सारणी (Benefit-sharing) कार्ययोजना
• जनस्वास्थ्य मूल्यांकन तथा कार्ययोजना
• जनसहभागिता तथा परामर्श योजना
• सञ्चार रणनीति तथा कार्ययोजना
• अंग्रेजी र नेपाली भाषामा यी दस्तावेजहरूको सारांश
• बाँध सुरक्षा योजना

ड. २. प्रस्तावित परियोजनाबाट पहिचान गरिने प्रशारण लाइन सम्बन्धी सवालहरू

प्रस्तावित परियोजनाको कार्यान्वयनका क्रममा नयाँ प्रशारण लाइनका लागि आवश्यक तयारी अध्ययन तथा प्रलेखन (Documentation concurrence) कार्यमा आर्थिक सहयोग प्रदान गर्न नेपाल सरकारले विश्व बैंकको सहमति लिन सक्नेछ। लक्षित प्रशारण लाइनमा लगानीको पहिचान भएपछि यसमा लागू हुने (Applicable) विश्व बैंकको नीतिहरू साथै राष्ट्रिय एउटै नियमहरूको नियमानुसार गरन र नेपाल सरकारका प्रचलित कानून विधानहरू तथा विश्व बैंकको नीतिमा बासिखा आयोजक वातावरणीय तथा सामाजिक अध्ययनहरूको विस्तृत कार्यक्षेत्र (Terms of Reference) तयार पार्ने नेपाल विश्व वित्त प्रबिधिकरण र विश्व बैंकले प्रस्तावित परियोजनाको जोखि गरेको छ। वित्त प्रबिधिकरण लाइनको प्रभाव मूल्यीकरण कार्यले अन्य रेखीय पूर्वाधार जस्तै: सडक तथा अन्य प्रशारण लाइनहरूको समग्र प्रभावहरूमात्र ध्यान दिनेको छ। यसले आधिकारिक भू-उपयोग गरेकी, प्रतिकूल असरहरू जस्तै: पूनवासको सम्भावना, बन पिडित र भू-शक्ति/कटान हुन नदिने बा ल्यूनीकरण गरेका र राइट अफ वे (Right of Way) को लागि घटाउने गरी ल्यस्टा रेखीय पूर्वाधार योजना तथा विकास क्रियाकलापहरूसँग आवश्यक समन्वय तथा संयोजन कायम गरेका सघात पुनर्पुर्याउँछ।

ड.३. खण्ड “ख” र “ग” मा समेटिएका प्रस्तावित परियोजनाको अन्य पक्षहरूको लागि गर्नुपर्ने अध्ययनहरू

खण्ड “ख” अन्तर्गत विभिन्न अध्ययनहरू सम्पन्न गरेका आर्थिक सहयोग उपलब्ध गराइएको छ। यसले अन्य विषयहरू लागि नेपालमा रहेका चुनौती महत्वपूर्ण जलाशयहरूको जलस्रोत तथा जलविश्वास विकास योजनाको लागि जलाशयवायु प्रभावको फाइनालपहरू अधिक बढाउँदै। यसमा जलाशयगतिक मूलनको एकीकृत दारावर्त विकास तथा एकीकृत जलाशयर्गत योजना तयार गरेका कार्यहरू पर्दछन्। यसले जलाशय रटर्मा जलस्रोतको उपयोग, वितरण तथा दिगो व्यवस्थापनको लागि योजना बनाउन र वातावरणीय तथा सामाजिक पक्षहरूमा विमोचन ध्यान केन्द्रित गरेका रणनीतिक वातावरणीय तथा सामाजिक मूल्यांकनलाई समेट समांबेल गरेको छ। खण्ड “ग” अन्तर्गत गरिएका अर्को महत्वपूर्ण काम
हो- वन फँडानीको प्रतियोगितालाई अफ व्यवस्थित तथा नियमसंगत बनाउन। यो काम वन सम्बन्ध
निकायहरूको नेतृत्वमा र वन तथा ब्यवजनने क्षेत्रसंगमो निर्धारित सहभागिता तथा परामर्शमा सम्पन्न
गरिनेछ। यसको विषयमा वन फँडानी गर्नुपने अवश्यकतालाई कमजोर गराउन। र यसमा संलग्न
निकायहरूको मूल्यात्मक आदानप्रदान कार्यलाई अफ बस्ने प्रभावकारी वनाउन संभव
तथा प्राथमिक प्रतियोगितालाई पुनरावलोकन गरियो उनीहरूको वन फँडानी गर्ने कार्यक्षमता बढाउनेछ।

यसैले, खण्ड "ग" ने ऊर्जा विवात मुख्यतः जलविचुलको लागि जिम्मेदार नेपाल सरकारको
महत्वपूर्ण निकायहरूको वातावरणीय तथा सामाजिक व्यवस्थापन प्राधिकृत तथा त्यसर्ग सम्बन्ध
पक्षहरूको श्रमिता विकास गर्ने कार्यक्षम दिनेछ। अध्ययन तथा कियाकलापहरूले नीतिगत विकास
tथा समाप (Cumulative)/रणनीतिक प्रभाव मूल्यांकनको लागि श्रमिता विकास, पर्यावरणीय प्रणाली,
जलविचुलु पुनर्वास तथा लाम बॉडफाउंड, लैप्टैक समानता, र जलवायु परिवर्तन तथा प्रकोप जीविक
व्यवस्थापनको पक्षहरूलाई जलविचुलु तथा जलाधार योजनामा समावेश गरेछन्। यी कार्यकलापले प्राधिक
लागनको राइट अफ वे (ROW) बापट श्रमिता प्रदान गर्ने नेपाल विवृत प्राधिकृतको कमरेट नीति
tर्जुमा गर्ने कियाकलापहरूलाई समेत एकसाथ अधिक बढाउनेछ।

च. संस्थागत विकास तथा अनुगमनको व्यवस्था

नेपाल सरकारकेने रहेका तल उल्लेखित निकायहरूले प्राधिकृत काम करामा दिइ त्यसको नीतिशक्ति
(Oversee) गरेछन् (नेपाल विवृत प्राधिकृत खण्ड "क" अन्तर्गतका विशिष्ट लगाईहरूको अध्ययनका
लागि जिम्मेदार गरिनेछ, जल तथा ऊर्जा आयोगको सांचिलाप (WECS) एकीकृत जलाधार योजना सहित खण्ड "ख"
अन्तर्गतका अध्ययनहरूको लागि जिम्मेदार रहिनेछ, र विवृत प्राधिकृत विभाग (DOED) खण्ड "ग" अन्तर्गतका
अध्ययन तथा श्रमिता विकास कियाकलापहरूको लागि जिम्मेदार रहिनेछ। समय परियोजनाको व्यवस्थापन सम्बन्धित परियोजना
व्यवस्थापन इकाई (PMUs) ले गरेछन्। खण्ड "ख" र "ग" को थप संयोजन कार्य एक उच्चस्तरिय
केन्द्रीय परियोजना सज्ज्वालन समिलिने ऊर्जा सचिव ज्यूताई सिध्द प्रतिबद्ध गरिएर गरेछ।

छ. सार्वजनिक परामर्श तथा संब्हार रणनीतिको सक्षम विवरण

अहिलेसम्म परियोजनाको लागि दुई चरणको सार्वजनिक परामर्श सम्पन्न भएका छन्। पहिलो चरणको
परामर्श माथिलो अरुण जलविचुलु परियोजना र इखाबाट खोला जलविचुलु परियोजनालाई सम्बन्धित
थियो। २०७१ साल वैशाख १५ गते आयोजित उक्त परामर्श कार्यक्रम प्रस्तावित यस परियोजनाको
tयारी स्वरुप वातावरणीय तथा सामाजिक प्रभाव मूल्यांकनको प्रारंभिक सम्मिलित
(TEORS) र सामाजिक योजना अध्ययनहरूको विषयमा केन्द्रित रहेका थियो। परामर्श कार्यक्रममा जान
पुष्टीको पाइसा समावेश गर्ने नेपाल विवृत प्राधिकृतलाई उक्त TEORS (जुन ESMF को पूर्ण पाइको
अनुसरणीमा समावेश गरिएको छ) लाई अवायित गरिएको छ। सम्मिलित अध्ययनहरूमा थप
परामर्श कार्यक्रमको आयोजना गरिनेछ।

परियोजनाको सरोकारवालाहरूसँग परामर्श गर्ने नेपाल विवृत प्राधिकृत, विवृत प्राधिकृत विभाग र जल
तथा ऊर्जा आयोगको सञ्चालनले २०७१ साल पुष ५ गते दोस्रो चरणको सार्वजनिक
परामर्श कार्यक्रमको आयोजना गन्यो। उक्त कार्यक्रममा परियोजनाका सम्पूर्ण खण्डहरु
(Components) का बातावरणीय तथा सामाजिक रणनीतिहरू, पालना गर्नुपैं कानुनी प्राधिकार तथा प्रक्रियाहरूको पहिचान गरेको छ। साथै यसले माथिल्लो अरुण जलविद्युत् परियोजना तथा इस्तेमाल खोला जलविद्युत् परियोजनाको लगानीहरूको बातावरणीय तथा सामाजिक मूल्यांकन तथा अध्ययनहरूको विस्तृत काय्यक्षेत्र (TORs) को बनाएको छ। यस परियोजना अन्तर्गत पहिचान गरी अध्ययन गरिने प्रशासन लाइनको लगानीमा यस्तै प्रकारको रामर्नां कार्यक्रमहरू आवश्यक पर्ने अनुमान गरिएको छ। यसैगरी खण्ड “ग” अन्तर्गत एक क्रियालाई रूपमा रहेको जलविद्युतका लागि बातावरणीय तथा सामाजिक नियमावली तथा कार्यविधिहरूको अध्ययन निर्माण केन्द्रका अतिरिक्त राष्ट्रियस्तरमा सार्वजनिक क्षेत्र तथा नागरिक समाजका सरोकारवालाहरूसँग बृहत् परामर्श गरिनेछ। त्यसैलाई संकलन गरिने विविध क्षेत्रका सरोकारवालाहरूको सुभाषित नीति तथा नियमहरूको अध्ययन गर्दा उभिल स्थान दिइएको छ।

यस बाहेक नेपाल विद्युत् प्राधिकरणले एउटा परियोजना-विशेष वेबसाइट सञ्चालन गर्नेछ जहाँ परियोजना अन्तर्गत त्यामा भुईहरूका विशेषता लगानीहरूका वारेमा जानकारी प्राप्त गर्न सकिनेछ। हाल नेपाल विद्युत् प्राधिकरणले आफ्नो वेबसाइटमा माथिल्लो अरुण जलविद्युत् परियोजना तथा इस्तेमाल खोला जलविद्युत् परियोजना सम्बन्धी जानकारीहरू प्रकाशित गर्दै आएको छ। तल दिइएको वेब ठाणामाफिन उल्क वेबसाइटको पहुँच प्राप्त गर्न सकिनेछ:

नेपाल विद्युत् प्राधिकरण: http://www.nea.org.np/publications.html
